Re:	IEEE P802.16-2004/Cor1-D3	
Abstract	Correct the misfortunate combination of interleaver and permutation	
Purpose	Adopt changes	
Notice	This document has been prepared to assist IEEE 802.16. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.	
Release	The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE's name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE's sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.	
Patent Policy and Procedures	The contributor is familiar with the IEEE 802.16 Patent Policy and Procedures < http://ieee802.org/16/ipr/patents/policy.html >, including the statement "IEEE standards may include the known use of patent(s), including patent applications, provided the IEEE receives assurance from the patent holder or applicant with respect to patents essential for compliance with both mandatory and optional portions of the standard." Early disclosure to the Working Group of patent information that might be relevant to the standard is essential to reduce the possibility for delays in the development process and increase the likelihood that the draft publication will be approved for publication. Please notify the Chair < mailto:chair@wirelessman.org > as early as possible, in written or electronic form, if patented technology (or technology under patent application) might be incorporated into a draft standard being developed within the IEEE 802.16 Working Group. The Chair will disclose this notification via the IEEE 802.16 web site < http://ieee802.org/16/ipr/patents/notices >.	

Problem in Interleaver and Permutation Combination in OFDMA

Ayelet Doron, Yuval Lomnitz, Uri Perlmutter, Eyal Bick, Dov Andelman,
Assi Jakoby, Tzahi Weisman, Alexei Davydov

1. Motivation

The interleaver definition with $d=16$ might cause a performance degradation in some cases, due to a disastrous combination of interleaving and permutation. This is because, in OFDMA, the permutation actually performs an “interleaving like” operation, which partially reverse the current interleaver operation. This performance degradation occurs with burst allocations having low frequency diversity, for example bursts allocated to a single sub-channel. In these cases, adjacent coded bits might be transmitted on the same sub-carrier. Thus the interleaver operation becomes useless.

Simulation results show, in a worst case scenario, a DL degradation of about 4-5 dB at FER of 10^{-2} , with the current interleaver compared to the proposed interleaver scheme. In UL degradation is about 1-2dB in most cases. It is unreasonable to use an interleaver which might cause severe performance degradation in some cases, whereas it is supposed to improve the performance.

Thus, we propose to add an optional interleaving scheme to the CC- TB to allow equal (better) performance to all burst allocations.

3. Details

For an interleaver with dimension d , a pair of adjacent coded bits before the interleaver is separated after the interleaver by distance N_{cbps}/d bits. If a FEC block spans more than one slot duration, then several bits from the same FEC block are transmitted on each sub-carrier. These bits are distributed in the FEC block periodically, where the period equals the number of bits in a single symbol divided by the distance.

With the current interleaver dimension $d = 16$, for a worst case scenario (DL PUSC, burst allocation of 1 sub-channel, 4 slots in a FEC block, QPSK constellation) this period can be as small as 2 bits!! This example is depicted in Figure 1 where the numbers in brackets are the indices of the coded bits before the interleaver.

Figure 1: Worst case scenario of permutation-interleaver combination

The reason for this is that the order of subcarriers passed to the de-interleaver (in the receive side) is not a linear frequency-domain order (which the interleaver was designed for), but an arbitrary order. This order depends on the permutation, on the way the 48 logical subcarriers are mapped to physical subcarriers, on the in-slot rotation between subchannels, and on the way the slots are aggregated. The following figure shows the correlation structure in a FEC block on which the de-interleaver works (and of which the interleaver is unaware):

Similar colors mean high correlation (of fading):

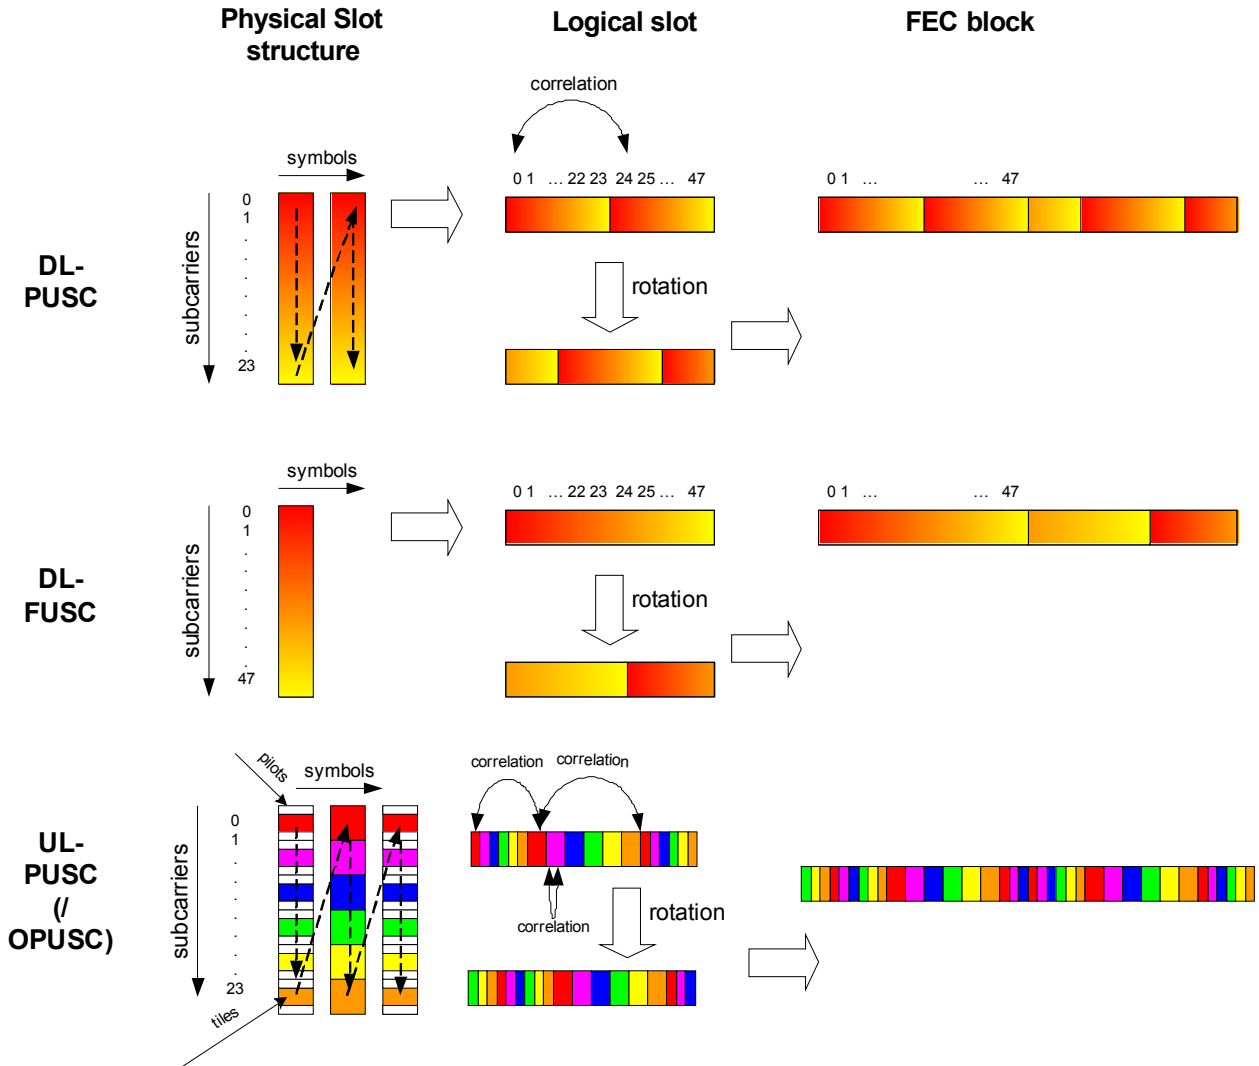

Figure 2: Example of correlation in slot and FEC block

The seemingly "random" structures of correlations in the FEC block are processed by the de-interleaver and create another "seemingly random" correlation structure at the input to the decoder. However, since these sequences are repetitive and not random, there are unfortunate choices of FEC block size for each permutation that create high correlations and reduce the performance significantly.

4. Simulation results

A subset of the simulation results is given here; more results are in the appendices. The legend specifies the interleaver dimension (existing interleaver is $d=16$).

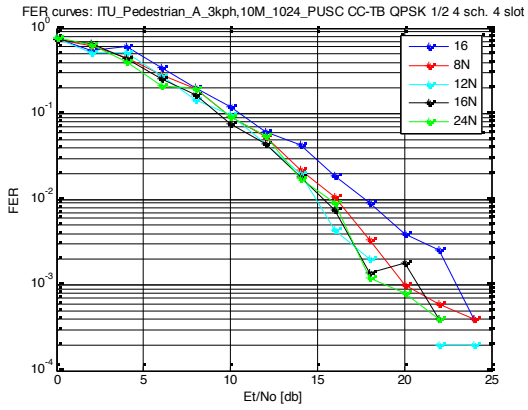

4.1. Downlink

In the simulations below we simulated two cases:

- DL MAP emulator case – FEC blocks with 4 slots mapped over 4 sub-channels
ITU PED A 3Km/h ITU PED B 3Km/h and ITU VEH A 60Km/h.
20MHz, FFT Size – 2048:

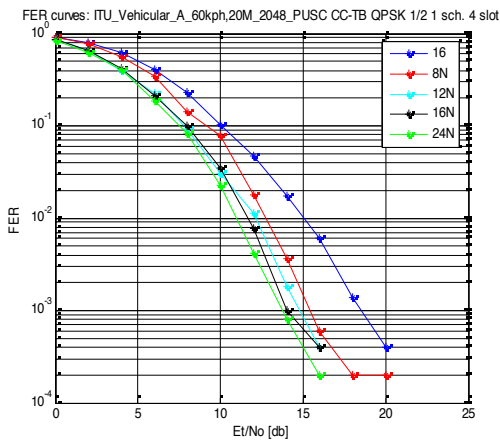

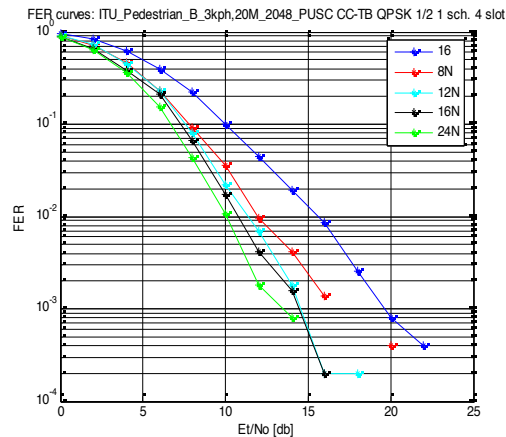

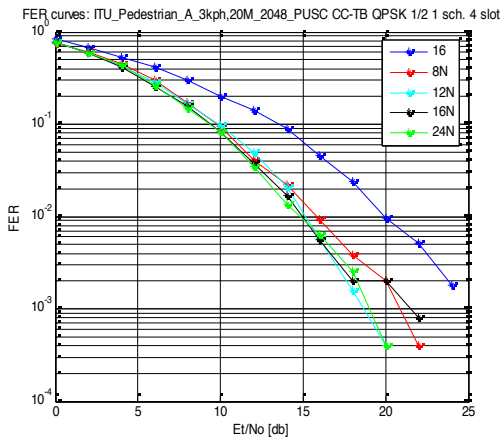

10MHz, FFT Size – 1024:

A 2 dB gain is evident for $d=16N$ in comparison to $d=16$ for ITU- PED A 3Km/h and ITU VEH A 60Km/h.

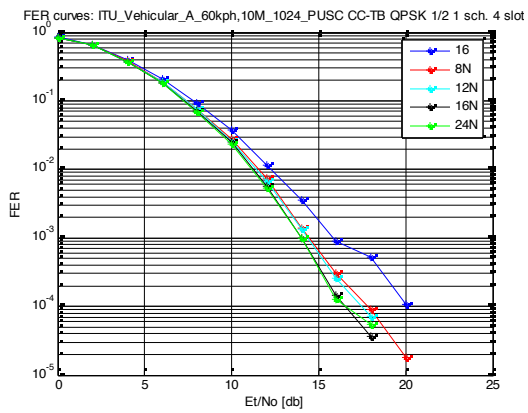

2. worst case – FEC blocks with 4 slots mapped over 1 sub-channel in PUSC
 The worst case is in terms of distance between bits after interleaving and permutation. In worst case, each other bit at encoder output is mapped to a sub carrier with the same frequency.

20MHz, FFT Size – 2048:

The performance gain is 5dB in ITU PED A channels and around 3dB for ITU VEH A 60Km/h when comparing $d=16N$ and $d=16$.

10MHz, FFT Size – 1024

The performance gain is 5dB in ITU PED A/B channels and around 1-2dB for fast channels as ITU VEH A 60Km/h when comparing $d = 16N$ and $d = 16$.

4.2. Uplink

20MHz, FFT Size – 2048:

- 1 sub channel ~108 bytes bursts, all MCS.

2. 4 sub channels ~144bytes bursts, all MSC

3. 1 sub channel 4 slots, QPSK 1/2.

4. 4 sub channels 4 slots QPSK 1/2.

10MHz, FFT Size – 1024:

5. 1 sub channel ~108 bytes bursts, all MCS.

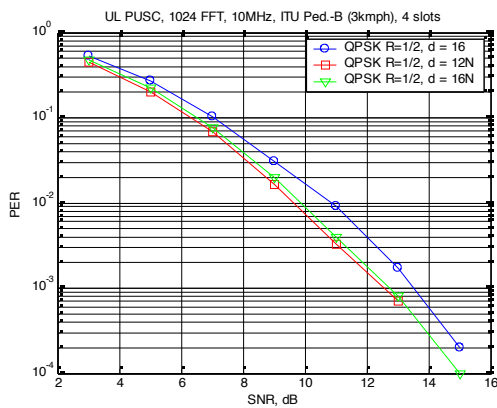

6. 4 sub channels ~144bytes bursts, all MCS.

7. 1 sub channel 4 slots, QPSK 1/2.

8. 4 sub channels 4 slots, QPSK 1/2.

The simulations show 2dB performance improvement over when comparing d=16N and current interleaver d=16.

5. Interleaver distance design (d)

5.1. DL

In DL PUSC permutation selecting $d = 24N$ (where N is the number of slots) results in adjacent bits sub carriers spread of 2 logical sub carrier \sim (spread $> 8-12$) physical sub carriers, if we select $16N$ then the logical sub carrier spread is 3 \sim (spread $> 12-18$) physical sub carrier spread. The sub carrier spacing assumed is 10 KHz.

12-18 physical sub carriers is around 120-180 KHz which assumes channel coherence time of = 6- 8 us.

Although simulation results show slightly better performance of $d = 24N$ over $d = 16N$, we chose $d = 16N$ because of its advantage for channels with large coherence bandwidths. In these channels frequency diversity is important and $d = 16N$ will give improved performance due to its higher frequency diversity.

5.2. UL

A UL PUSC slot is composed of three time symbols and one sub channel. The sub channel is constructed from six uplink tiles. Each tile has three pilots and 8 data sub carrier symbols. For first and third time intervals 12 sub carriers (2 per tile) are allocated for data transmission and 24 sub carriers (4 per tile) for central symbol. UL PUSC permutation consists from two steps

Outer permutation – tile permutation

Inner permutation – sub channel-dependent sub carrier shift within slot

During outer permutation the tiles that come from single slot are spread over whole frequency band. So, it can be assumed for further analysis that channel gains on sub carriers *within tile are correlated* and sub carriers *from different tiles are uncorrelated*.

Figure 3. UL PUSC slot structure

Based on this assumption, we can formulate the criteria for interleaving parameters selection: *The adjacent bits after interleaving shall be placed on sub carriers of different tiles.*

This results in selecting $d = 12N$ or $16N$. Simulation results showed that $16N$ gives better performance.

Also simulation results were performed for AMC permutation in order to check that the change does not degrades performance in AMC. This is evident in the AMC simulation results which show similar performance for $d=16$ and $d=16N$.

6. Changes summary

We present an additional optional interleaver distance, which is summarized in the following table:

	Optional interleaver
Interleaver dimension UL	$16N$
Interleaver dimension DL	$16N$
Sub-channel reordering	$k+48*n$ (Stays the same)
In-slot rotation ($n+13*s$)	Stays the same
Repetition	Stays the same

where

N – number of allocated slots per FEC block

k – sub-carrier index

n – slot index

6.1. Proposed Interleaver change

Add an optional interleaver option which changes the interleaver dimension to be dependent on the number of slots in FEC block (N). Specifically, the interleaver dimension in the UL is $16N$, and in the

DL is 16N.

7. Text changes

7.1. Change FCH data structure

8.4.4.3 DL Frame Prefix

Change the text in coding indication in Table 266—OFDMA downlink Frame Prefix format, as follows:

Syntax	Size	Notes
Coding_Indication	3 bits	0b000 - CC encoding used on DL-MAP 0b001 - BTC encoding used on DL-MAP 0b010 - CTC encoding used on DL-MAP 0b011 = ZT CC used on DL-MAP 0b100 = CC encoding with optional interleaver. 0b101 to 0b111 -Reserved

7.2. Change capability negotiation

11.8.3.7.3 OFDMA SS modulator

Remove and change the following in OFDMA SS modulator TLV.

Type	Length	Value	Scope
152	1	Bit# 0: 64-QAM Bit# 1: BTC Bit# 2: CTC Bit #3: AAS Diversity Map ScanReserved; shall be set to zero Bit# 4: AAS Direct SignalingReserved; shall be set to zero Bit# 5: H-ARQ Bits# 6 CC with optional interleaver. Bit# 7: Reserved; shall be set to zero	SBC-REQ (see 6.3.2.3.23) SBC-RSP (see 6.3.2.3.24)

11.8.3.7.2 OFDMA SS demodulator

Remove and change the following in OFDMA SS demodulator TLV.

Type	Length	Value	Scope
152	1	Bit# 0: 64-QAM Bit# 1: BTC Bit# 2: CTC Bit #3: AAS Diversity Map ScanReserved; Bit#3 CC with optional interleaver. shall be set to zero Bit# 4: AAS Direct SignalingReserved; shall be set to zero Bit# 5: H-ARQ Bits# 6-7: Reserved; shall be set to zero	SBC-REQ (see 6.3.2.3.23) SBC-RSP (see 6.3.2.3.24)

Note that Bit#3 in 802.16e is redundant since it is defined in 11.8.3.7.5 OFDMA SS Demodulator for MIMO support of Cor1D3 of 802.16d.

7.3. Change UCD

Change the text FEC Code type and modulation type in Table 357—UCD burst profile encodings WirelessMAN-OFDMA.

Name	Type	Length	Value
FEC Code type and modulation type	150	1	0 = QPSK (CC) 1/2 1 = QPSK (CC) 3/4 2 = 16-QAM (CC) 1/2 3 = 16-QAM (CC) 3/4 4 = 64-QAM (CC) 1/2 5 = 64-QAM (CC) 2/3 6 = 64-QAM (CC) 3/4 7 = QPSK (BTC) 1/2 8 = QPSK (BTC) 3/4 or 2/3 9 = 16-QAM (BTC) 3/5 10 = 16-QAM (BTC) 4/5 11 = 64-QAM (BTC) 2/3 or 5/8 12 = 64-QAM (BTC) 5/6 or 4/5 13 = QPSK (CTC) 1/2 14 = Reserved 15 = QPSK (CTC) 3/4 16 = 16-QAM (CTC) 1/2 17 = 16-QAM (CTC) 3/4 18 = 64-QAM (CTC) 1/2 19 = 64-QAM (CTC) 2/3 20 = 64-QAM (CTC) 3/4 21 = 64-QAM (CTC) 5/6 22 = QPSK (ZT CC) 1/2 23 = QPSK (ZT CC) 3/4 24 = 16-QAM (ZT CC) 1/2 25 = 16-QAM (ZT CC) 3/4 26 = 64-QAM (ZT CC) 1/2 27 = 64-QAM (ZT CC) 2/3 28 = 64-QAM (ZT CC) 3/4 29..43 = <i>Reserved</i> ¹ 44 = QPSK (CC with optional interleaver) 1/2 45 = QPSK (CC with optional interleaver) 3/4 46 = 16-QAM (CC with optional interleaver) 1/2 47 = 16-QAM (CC with optional interleaver) 3/4 48 = 64-QAM (CC with optional interleaver) 2/3 49 = 64-QAM (CC with optional interleaver) 3/4 50..255 = <i>Reserved</i>

Note that in 802.16e the code 5 = 64-QAM (CC) 2/3 was added.

7.4. Change DCD

Change the text FEC Code type and modulation type in Table 361—DCD burst profile encodings WirelessMAN-OFDMA.

Name	Type	Length	Value

¹ Reserved for 802.16e

FEC Code type and modulation type	150	1	0 = QPSK (CC) 1/2 1 = QPSK (CC) 3/4 2 = 16-QAM (CC) 1/2 3 = 16-QAM (CC) 3/4 4 = 64-QAM (CC) 1/2 5 = 64-QAM (CC) 2/3 6 = 64-QAM (CC) 3/4 7 = QPSK (BTC) 1/2 8 = QPSK (BTC) 3/4 or 2/3 9 = 16-QAM (BTC) 3/5 10 = 16-QAM (BTC) 4/5 11 = 64-QAM (BTC) 2/3 or 5/8 12 = 64-QAM (BTC) 5/6 or 4/5 13 = QPSK (CTC) 1/2 14 = Reserved 15 = QPSK (CTC) 3/4 16 = 16-QAM (CTC) 1/2 17 = 16-QAM (CTC) 3/4 18 = 64-QAM (CTC) 1/2 19 = 64-QAM (CTC) 2/3 20 = 64-QAM (CTC) 3/4 21 = 64-QAM (CTC) 5/6 22 = QPSK (ZT CC) 1/2 23 = QPSK (ZT CC) 3/4 24 = 16-QAM (ZT CC) 1/2 25 = 16-QAM (ZT CC) 3/4 26 = 64-QAM (ZT CC) 1/2 27 = 64-QAM (ZT CC) 2/3 28 = 64-QAM (ZT CC) 3/4 <u>29..43 = Reserved²</u> <u>44 = QPSK (CC with optional interleaver) 1/2</u> <u>45 = QPSK (CC with optional interleaver) 3/4</u> <u>46 = 16-QAM (CC with optional interleaver) 1/2</u> <u>47 = 16-QAM (CC with optional interleaver) 3/4</u> <u>48 = 64-QAM (CC with optional interleaver) 2/3</u> <u>49 = 64-QAM (CC with optional interleaver) 3/4</u> <u>50..255 = Reserved</u>
-----------------------------------	-----	---	--

Note that in 802.16e the code 5 = 64-QAM (CC) 2/3 was added.

7.5. Addition of an optional interleaver with change of interleaver dimension

[Add a section with optional Interleaver for CC]

8.4.9.3.1 Optional interleaver for CC

[Add the following sentence]

For the CC optional interleaver, the interleaver structure is as defined in 8.4.9.3. The value of d in equations 126-129 shall be set to 16n for the DL and 16n for the UL, where n is the number of allocated slots per FEC block.

Number of subchannels	2	2	2	2	2
Number of slots	2	4	6	2	2
Packet length	12	24	36	24	36

4 Sub channel allocation

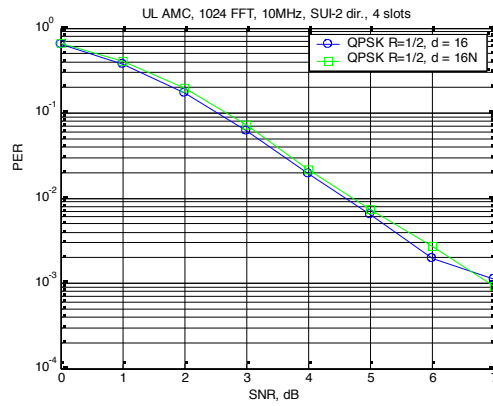

MCS	QPSK R=1/2
Number of subchannels	4
Number of slots	4
Packet length	24

Appendix CCC 1 sub channel

Appendix DDD 2 sub channels

Appendix EEE 4 sub channel
