- DL PHY control structure

Base Contribution:
This is base contribution.
Purpose:
Propose to be discussed and adopted by TGm for IEEE 802.16m Amendment.
Notice:
This document does not represent the agreed views of the IEEE 802.16 Working Group or any of its subgroups. It represents only the views of the participants listed in the "Source(s)" field above. It is offered as a basis for discussion. It is not binding on the contributor(s), who reserve(s) the right to add, amend or withdraw material contained herein.

## Release:

The contributor grants a free, irrevocable license to the IEEE to incorporate material contained in this contribution, and any modifications thereof, in the creation of an IEEE Standards publication; to copyright in the IEEE's name any IEEE Standards publication even though it may include portions of this contribution; and at the IEEE's sole discretion to permit others to reproduce in whole or in part the resulting IEEE Standards publication. The contributor also acknowledges and accepts that this contribution may be made public by IEEE 802.16.
Patent Policy:
The contributor is familiar with the IEEE-SA Patent Policy and Procedures:

## SCH Architecture for 802.16 m

## Legacy Support

## P-SCH Structure (1/2)

■ Subcarrier spacing is four times larger than that of regular data OFDM symbols
■ Useful subcarrier number is 106
■ Binary code with code length 97 is suggested
$\square 3$ code sequences for different channel bandwidths (512FFT, 1024-FFT, 2048-FFT) for sector \#1
$\square 3$ code sequences for different channel bandwidths (512FFT, 1024-FFT, 2048-FFT) for sector \#2
$\square 3$ code sequences for different channel bandwidths (512FFT, 1024-FFT, 2048-FFT) for sector \#3
$\square 1$ code sequence for non-fully configured carrier
$\square$ Total number of code sequences: 10

## P-SCH Structure (1/2)

- Guard chips are applied to provide better crosscorrelation property for code sequence detection
$\square$ Left guard chip: 4 subcarriers
$\square$ Right guard chip: 4 subcarriers
■ Code sequence is divided into two parts
$\square$ Different ordering of two parts can be used to differentiate regular frame header from superframe header
- There is 2-period time-domain structure in P-SCH

## Frequency-Domain Illustration for Regular Frame

## Frequency-Domain Illustration for Superframe

## S-SCH Structure

- Subcarrier spacing is two times larger than that of regular data OFDM symbols
- Useful subcarrier number is 204
- Zadoff-Chu or binary code sequences are suggested
$\square$ Since integer frequency offset is already compensated in P-SCH, there is no need to consider it in code sequence design
- Full cell ID information is carried in 5 MHz channel bandwidth
- The code sequence is repeated outside 5 MHz bandwidth if larger channel bandwidth is applied
$\square$ Allow to exploit frequency diversity to alleviate orthogonality destruction effect on code sequences due to frequency selectivity
- There is 3-period time-domain structure in S-SCH
$\square$ Since S-SCH is only half time length of a regular OFDM symbol, there won't be confusion with legacy preamble for legacy MS

## Frequency-Domain Illustration

## Frequency Reuse Pattern for S-SCH

- Different frequency reuse patterns are applied to femtocells and macrocells to reduce interferences between them
- Femtocell can choose the best frequency reuse pattern for itself but it has to be paired with corresponding PSCH code sequence
- BS-type information can also be obtained by the combination of segment information carried by PSCH and frequency reuse pattern applied to S-SCH for fast cell ID search

## Frequency Reuse Patterns

S-SCH Frequency Reuse Pattern

## Mapping Table for BS-Type Information

| $\mathrm{S}_{\mathrm{S}-\mathrm{SCH}} \mathrm{P}-\mathrm{SCH}$ | Code for <br> Sector 1 | Code for <br> Sector 2 | Code for Sector 3 |
| :---: | :---: | :---: | :---: |
| Frequency <br> Partition Pink | Macrocell | Femtocell A | Femtocell B |
| Frequency <br> Partition Blue | Femtocell B | Macrocell | Femtocell A |
| Frequency Partition Green | Femtocell A | Femtocell B | Macrocell |

## Simulation Assumptions

- SISO case
- 3 cells with SIR $=6 \mathrm{~dB}$
- ITU-R PB $3 \mathrm{~km} / \mathrm{hr}$ multipath fading channel model
- Frequency offset $=4.8 \times 10.9375 \mathrm{KHz}$
- Timing is assumed imperfect
- Binary code sequences for P-SCH
$\square 10$ code sequences from 16e preamble code sequences for 128-FFT
- Zadoff-Chu code sequences for S-SCH
$\square 520$ code sequences
- SNR value is based on SCH time-domain power over noise power

## Simulation Results

## Conclusion

- A detailed SCH structure is proposed in this contribution

■ Even with 520 cell ID for detection, proposed SCH structure is still competitive to 16e preamble

- The performance of proposed SCH can be further improved by optimizing both applied code sequences and detection algorithm
■ Text proposal is in the following slides

## Text Proposal

Start of the Text
[Add the following into the TGm Amendment Document]

### 15.3.7.2.1 Synchronization Channel (SCH)

The synchronization channel (SCH) is a DL physical channel which provides a reference signal for time, frequency, and frame synchronization, RSSI estimation, channel estimation, and BS identification.

Two levels of synchronization hierarchy exist. These are called the primary synchronization channel (P-SCH) and secondary synchronization channel (S-SCH).

The P-SCH transmits one of [10] unique identifications to support the acquisition of physical cell/sector identifications transmitted in S-SCH.
The S-SCH transmits one of [520] complete physical cell/sector identifications.

There are 4 OFDM symbols located every 5 ms for P-/S-SCH in a single superframe and the P-SCH and S-SCH shall share one OFDM symbol in time length as shown in Figure X-1. P-SCH and S-SCH are multiplexed by TDM inside the OFDM symbol. Each pair of P-SCH and S-SCH is located in the first DL subframe of the frame and occupies the 1st symbol position within a subframe.

Figure X-1 Advanced Air Interface SCH Architecture

### 15.3.7.2.1.1 Primary Synchronization Channel (P-SCH)

In P-SCH, frequency reuse 1 shall be applied. The time length of P-SCH is $1 / 2 T_{b}$ and the occupied channel bandwidth is 5 MHz . The P-SCH is used for initial acquisition, superframe synchronization, channel estimation, and sending additional information.

### 15.3.7.2.1.1.1 P-SCH Modulation Series

The length of each P-SCH modulation series is [97]. The modulation and power boosting of P-SCH is FFS. The P-SCH series depends on the sector information, system bandwidth, and carrier information.

The series ( $W_{k}$ ) used for the P-SCH modulation is defined in Table X-1. Table X-1 includes a set of series in a hexadecimal format. The value of the P-SCH modulation series is obtained by converting the series ( $W_{k}$ ) to a binary sequence and mapping the converted sequence starting from the MSB of each symbol to the LSB. (0 mapped to +1 and 1 mapped to -1 . For example, $W_{k}=110000010010 \ldots$, and the mapping shall follow: $-1-1+1$ $+1+1+1+1-1+1+1-1+1 \ldots$...)

The equation (X-1) defines the mapping rule of the sector information, system bandwidth, and carrier information into P-SCH index, $I D_{P-S C H}$ as follows:

$$
I D_{P-S C H}=\left\{\begin{array}{ll}
N_{\text {Sector }}+3 \cdot N_{B W}, & \text { if } N_{\text {Carrier }}=0  \tag{X-1}\\
9 & \text {, if } N_{\text {Carrier }}=1
\end{array}\right. \text {, }
$$

where

- $\quad N_{\text {Sector }}$ denotes the sector index with 0,1 , and 2 .
- $\quad N_{B W}$ denotes the bandwidth indication with 0,1 , and 2 , and thus, the indices 0,1 , and 2 represent 512FFT, 1024-FFT, and 2048-FFT, respectively.
- $\quad N_{\text {Carrier }}$ represents the carrier type whether this carrier is a fully-configured carrier, i.e., $\quad N_{\text {Carrier }}=0$, or a partially-configure carrier, i.e., $\quad N_{\text {Carrier }}=1$.

Table X-1 P-SCH modulation series [TBD]

| $I D_{P-S C H}$ | Series to modulate $\left(W_{k}\right)$ |
| :---: | :---: |
| 0 | $\ldots$ |
| 1 | $\ldots$ |
| 2 | $\ldots$ |
| 3 | $\ldots$ |
| 4 | $\ldots$ |
| 5 | $\ldots$ |
| 6 | $\ldots$ |
| 7 | $\ldots$ |
| 8 | $\ldots$ |
| 9 | $\ldots$ |

### 15.3.7.2.1.1.2 Transmission of P-SCH Series

The subcarrier spacing of P-SCH is four times larger than that of a regular data OFDM symbol. Each subcarrier is modulated using a boosted BPSK modulation with a specific series defined in 15.3.7.2.1.1.1. After inverse FFT, the time domain samples are duplicated into two copies to form one P-SCH. In other words, the P-SCH in the time domain has two repeated waveform.

In regular frame header, the subcarrier modulation for P-SCH is provided by the following equation (X-2)

$$
\text { Subcarrier }(x)_{P-S C H}=\left\{\begin{array}{l}
W_{k}(x-o f f s e t+97), \text { if } x \geq \text { offset }-4 \text { and } x \leq \text { offset }-1  \tag{X-2}\\
W_{k}(x-o f f s e t), \text { if } x \geq \text { offset and } x \leq o f f s e t+48 \\
W_{k}(x-o f f s e t-1), \text { if } x \geq \text { offset }+50 \text { and } x \leq \text { offset }+97 \\
W_{k}(x-\text { offset }-98), \text { if } x \geq \text { offset }+98 \text { and } x \leq \text { offset }+101 \\
\text { nulled, otherwise }
\end{array},\right.
$$

where Subcarrier $(x)_{P-S C H}$ represents the subcarrier with running index $x$ and $W_{k}(I)$ represents the lth digit of the modulated P-SCH series. $x$ ranges from 0 to 127 and offset is equal to 15 for the channel bandwidth of $5 \mathrm{MHz} x$ ranges from 0 to 255 and offset is equal to 79 for the channel bandwidth of $7,8.75$ and 10 MHz ; $x$ ranges from 0 to 511 and offset is equal to 207 for the channel bandwidth of 20 MHz . Figure X-2 illustrates an example of PSCH frequency domain structure in regular frame header for channel bandwidths of 5, 10 and 20 MHz .

Figure X-2 Example of P-SCH Frequency Domain Structure in Regular Frame Header

In superframe header, the subcarrier modulation for P-SCH is provided by the following equation (X-3)

$$
\text { Subcarrier }(x)_{P-S C H}=\left\{\begin{array}{l}
W_{k}(x-\text { offset }+4), \text { if } x \geq \text { offset }-4 \text { and } x \leq \text { offset }-1  \tag{X-3}\\
W_{k}(x-o f f s e t+48), \text { if } x \geq \text { offset and } x \leq \text { offset }+48 \\
W_{k}(x-\text { offset }-50), \text { if } x \geq \text { offset }+50 \text { and } x \leq \text { offset }+97 \\
W_{k}(x-\text { offset }-5), \text { if } x \geq \text { offset }+98 \text { and } x \leq \text { offset }+101 \\
\text { nulled, otherwise }
\end{array},\right.
$$

where Subcarrier $(x)_{P-S C H}$ represents the subcarrier with running index $x$ and $W_{k}(I)$ represents the lth digit of the modulated P-SCH series. $x$ ranges from 0 to 127 and offset is equal to 15 for the channel bandwidth of 5 MHz ; $x$ ranges from 0 to 255 and offset is equal to 79 for the channel bandwidth of $7,8.75$ and 10 MHz ; $x$ ranges from 0 to 511 and offset is equal to 207 for the channel bandwidth of 20 MHz . Figure X-3 illustrates an example of PSCH frequency domain structure in superframe header for channel bandwidths of 5,10 and 20 MHz .

Figure X-3 Example of P-SCH Frequency Domain Structure in Superframe Header

### 15.3.7.2.1.2 Secondary Synchronization Channel (S-SCH)

In S-SCH, frequency reuse 3 shall be applied. The time length of S-SCH is $T_{g}+1 / 2 T_{b}$ and S-SCH occupies full bandwidth. The S-SCH is used for fine synchronization, RSSI measurement, and cell/sector identification (ID).

### 15.3.7.2.1.2.1 S-SCH Modulation Series

The length of each S-SCH modulation series is [67] for any channel bandwidth. Full cell ID information shall be carried inside the minimal supported channel bandwidth -5 MHz . The modulation and power boosting of S-

SCH is FFS.

The S-SCH series modulating the subcarriers is generated from Zadoff-Chu sequences with parameters $u$ and $S$ defined in Table X-2.1~2.4, where Table X-2.4 is for femtocells only.

Table X-2.1 S-SCH modulation series [FFS]

| Cell ID | Segment | u | S | Cell ID | Segment | u | S | Cell ID | Segment | u | S |

### 15.3.7.2.1.2.2 Transmission of S-SCH Series

The subcarrier spacing of S-SCH is two times larger than that of a regular data OFDM symbol. Every third
subcarrier is modulated using a boosted value with a specific series defined in 15.3.7.2.1.2.1. The subcarrier modulation for S-SCH is provided by the following equations, which are FFS. DC tone shall be nulled.

Figure X-4 illustrates an example of S-SCH frequency domain structure for channel bandwidths of 5, 10 and 20 MHz.

Figure X-4 Example of S-SCH Frequency Domain Structure

For the deployment of femtocells, interferences between femtocells and other cells in S-SCH shall be mitigated. The interference mitigation scheme is FFS.

### 15.3.7.2.1.3 Support of WirelessMAN-OFDMA

Advanced Air Interface shall exist in both green field and mixed deployments. In mixed deployments, the WirelessMAN-OFDMA preamble shall be always present. The Advanced Air Interface SCH shall enable AMSs to synchronize in frequency and time without requiring WirelessMAN-OFDMA preamble.

Figure X-5 shows an example of Advanced Air Interface SCH architecture in mixed deployments.

Figure X-5 Advanced Air Interface SCH Architecture Supporting WirelessMAN-OFDMA

## Appendix

## Related Issues (1/3)

- Is there any ISI?
$\square$ No, since the repeated waveform in P-SCH is generated by duplicate one time domain sequence into two copies, the first copy plays a role of CP and there is no ISI anymore
- Do we have to apply different sampling frequency?
$\square$ No, sampling frequency remains the same as regular data OFDM symbols. The only difference is shorter symbol time.
- Do we need another FFT size for P-SCH and S-SCH?
$\square$ No, we can reuse original FFT size by rearranging the sequence and multiplying a normalized factor to it
$\square$ However, MS still needs to keep 3 FFT sizes to adapt to different channel bandwidths
- 512-FFT, 1024-FFT and 2048-FFT

## Related Issues (2/3)

- 128-point Fourier transform using 512-FFT
$\square$ Step 1: Upsample time domain series from the length of 128 to 512 by inserting three zeros between any two consecutive non-zero values
$\square$ Step 2: Use 512-FFT for the upsampled series
$\square$ Step 3: Take the first 128 values
$\square$ Step 4: Multiply these 128 values by $\sqrt{4}$
- 128-point Inverse Fourier transform using 512-IFFT
$\square$ Step 1: Upsample frequency domain series from the length of 128 to 512 by inserting three zeros between any two consecutive non-zero values
$\square$ Step 2: Use 512-IFFT for the upsampled series
$\square$ Step 3: Take the first 128 values
$\square$ Step 4: Multiply these 128 values by $\sqrt{4}$

## Related Issues (3/3)

■ Shorter P-SCH will induce less collected energy for SCH detection?
$\square$ Autocorrelation algorithm is to utilize the time domain structure of SCH for detection
$\square$ Proposed SCH architecture has very unique time domain structure than regular data OFDM symbols and it can be utilized for SCH detection
$\square$ Autocorrelation algorithm can be modified to improve the detection performance

- Two suggestions are illustrated in the following slides

## SCH Autocorrelation Detection (1/3)

- Auto-correlation approach can be applied
$\square$ Prior art: S\&C algorithm, 1/4Tu $\boldsymbol{X P}$ energy can be collected

$$
\begin{aligned}
& \Gamma(\tilde{t})=\frac{\sum_{k=\tilde{f}}^{\tilde{t}+N / 4-1} r(k+N / 4) r^{*}(k)}{\sum_{k=\tilde{f}}^{\tilde{t}+N / 4-1}|r(k+N / 4)|^{2}}, \\
& \hat{t}=\underset{\tilde{t}}{\arg \max }\left\{|\Gamma(\tilde{t})|^{2}\right\},
\end{aligned}
$$

where $N$ is the FFT size of a regular OFDM symbol, $r(\cdot)$ is the received signal.

## SCH Autocorrelation Detection (2/3)

- To collect more energy for SCH timing detection, autocorrelation approach is modified
$\square$ Algorithm 01: 3/8Tu $\mathbf{P} \boldsymbol{P}$ energy can be collected

## SCH Autocorrelation Detection (3/3)

- To collect more energy for SCH timing detection, autocorrelation approach is modified
$\square$ Algorithm 02: 17/24Tu $\times \mathbf{P}$ energy can be collected if there is 3-period time domain structure in S-SCH

$$
\begin{aligned}
& \Gamma(\tilde{t})=\frac{\sum_{k=\tilde{i}}^{\tilde{i}+N / 4-1} r(k+N / 4) r *(k)+\sum_{k=\tilde{i}+N / 2}^{\tilde{i}+N / 2+N / 8-1} r(k+N / 2) r *(k)+\sum_{k=\tilde{t}+N / 2+N / 8}^{\tilde{i}+N / 2+N / 8+\lfloor N / 3\rfloor} r(k+\lfloor N / 6\rfloor) r^{*}(k)}{\sum_{k=\tilde{i}}^{\tilde{i}+N / 4-1}|r(k+N / 4)|^{2}+\sum_{k=\tilde{i}+N / 2}^{\tilde{i}+N / 2+N / 8-1}|r(k+N / 2)|^{2}+\sum_{k=\tilde{i}+N / 2+N / 8}^{i+N / 2+N / 8+\lfloor N / 3\rfloor} \mid r\left(k+\left.\lfloor N / 6\rfloor\right|^{2}\right.}, \\
& \hat{t}=\underset{\tilde{i}}{\arg \max }\left\{|\Gamma(\tilde{t})|^{2}\right\}
\end{aligned}
$$

## Remarks

- Collected energy is small if directly applying S\&C algorithm to P-SCH in proposed SCH architecture
$\square$ Only $\mathbf{1 / 4 T u} \mathbf{X P}$ energy can be collected
- Due to unique structure of proposed SCH architecture, the modified auto-correlation algorithm can collect more energy to achieve better preciseness of SCH timing detection
$\square$ Algorithm 01: 3/8Tu $\mathbf{P P}$ energy can be collected
$\square$ Algorithm 02: 17/24Tu $\times \boldsymbol{P}$ energy can be collected if there is 3-period time domain structure in S-SCH

## Synchronization Procedure (1/4)

## Single-carrier Scenario:

- Step 1: Carrier searching
- Step 2: Coarse timing estimation using SCH time-domain structure
- Step 3: Fractional frequency offset estimation/compensation using P-SCH
- Step 4: Joint code sequence detection and integer frequency offset estimation/compensation using P-SCH
- Step 5: Fine timing correction using P-SCH and/or the cyclic prefix of SSCH
- Step 6: Cell ID detection using S-SCH
- Step 7: Check if detected cell ID is correct
$\square$ Yes, synchronization procedure completed
$\square$ No, adjust OFDM symbol timing and fractional frequency offset compensation by the following regular data OFDM symbols until next SCH comes and then go to step 2
- Step 2 and step 3, which can skipped, are for confirmation of symbol timing and fractional frequency offset estimation

## Synchronization Procedure (2/4)

## Synchronization Procedure (3/4)

## Multi-carrier Scenario:

- Step 1: Carrier searching
- Step 2: Coarse timing estimation using SCH time-domain structure
- Step 3: Fractional frequency offset estimation/compensation using P-SCH

■ Step 4: Joint code sequence detection and integer frequency offset estimation/compensation using P-SCH

- Step 5: Check if the carrier is a partially configured carrier
$\square$ Yes, go to step 1
$\square$ No, next step
- Step 6: Fine timing correction using P-SCH and/or the cyclic prefix of S-SCH
- Step 7: Cell ID detection using S-SCH
- Step 8: Check if detected cell ID is correct
$\square$ Yes, synchronization procedure completed
$\square$ No, adjust OFDM symbol timing and fractional frequency offset compensation by the following regular data OFDM symbols until next SCH comes and then go to step 2
- Step 2 and step 3, which can skipped, are for confirmation of symbol timing and fractional frequency offset estimation

## Synchronization Procedure (4/4)
