10 Gigabit Ethernet on FDDI Grade Multimode Fiber: A User's Perspective

Mike Bennett 1/8/2004

Discussion

- Why do we need this PHY?
- MMF Distribution at LBNL
- Brief Background on MBI data
- Conclusion

Why do we need this PHY?

- Currently 10 GbE has PMDs that support the following distances on optical fiber:
 - Up to 26 m on multimode (160 MHz*Km)
 - 10GBASE-SR/SW (Table 52-6 802.3ae)
 - Up to 10 Km on single mode fiber
 - 10GBASE-LR/LW (Table 52-11 802.3ae)
 - Up to 40 Km on single mode fiber
 - 10GBASE-ER/EW (Table 52-15 802.3ae)
- No other parts shipping that I know of

Why do we need this PHY? (cont.)

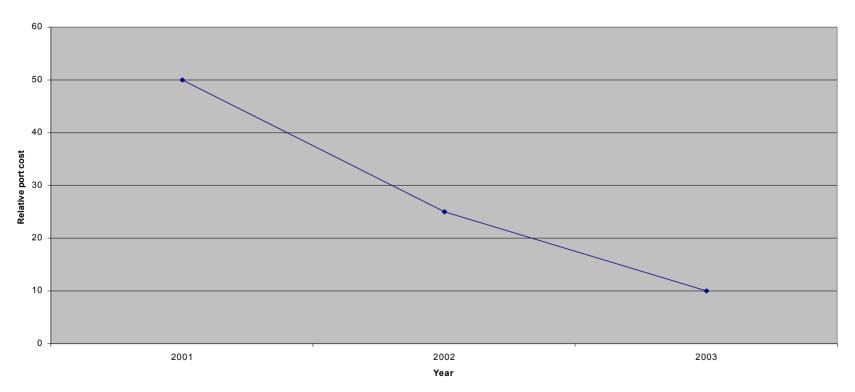

- 850 nm PMD is just now shipping
- We still can't get 10GBASE-LX4
- It's still expensive to provision optical 10 GbE
- IT budgets are still declining or flat
- There could be a significant cost savings if we could use the existing infrastructure

Why do we need this PHY? (cont.)

- Simply put, 10 GbE still costs too much
 - Although the costs are coming down

Cost of 10GbE Compared to 1 GbE

MMF Distribution at LBNL

LBNL's enterprise network:

- 4000 employees
- 6000 desktop computers
- More than 13,800 network attached devices
- Star topology
- 99% Ethernet
- 3048 Multimode fibers installed total
 - Includes 160 MHz*Km and 200 MHz*Km (850nm)
 - 1556 of these are less then or equal to 300m long
- Several of these fibers are among the worlds worst!

Brief Background on MBI data

July 1997

 David Cunningham and Mark Nowell presentation to 802.3z task force regarding modal bandwidth and laser launch behavior on MMF

November 1997

- DMD is a problem
- Modal Bandwidth Investigation subtask group presents initial field test results
 - Needed a bigger sample of installed MMF
- MBI group came to LBNL, LLNL and SNL to measure "real" installed fibers

- Several LBNL fibers were known to have problems
 - We ordered new fibers to prepare for FDDI in the early 90's
 - Made our own modal BW measurements with a Tektronix OF 192
 - Found that the fiber that was installed did not meet our specifications
 - The vendor made their own measurements and found the same
- Many of the "bad" fibers were used for MBW tests
 - In case you're interested, detailed information and the data can be found at:
 - http://grouper.ieee.org/groups/802/3/z/mbi/index.html

LAWRENCE BERKELEY NATIONAL LABORATORY

- The field test data files contain 1024 data points (time and amplitude) which is convenient for analysis
- Recently folks have come back to look as the same fibers in preparation for work to be done for the study group
 - Fibers are still "bad" ;-)
 - Interesting results that will be presented later

Conclusions

- There is a void in 10 GbE solution set
 - Even though a PMD was specified we don't have a MMF choice that works on the installed base
- IT budgets are no longer blank checks
 - Need low cost choices for optical 10 GbE
- Specifying a MMF solution that will operate on 300m of FDDI grade fiber will enable end users to save money on infrastructure
 - 51% of installed MMF at LBNL fall into that category
