

Crosstalk & Frankenstein Channels

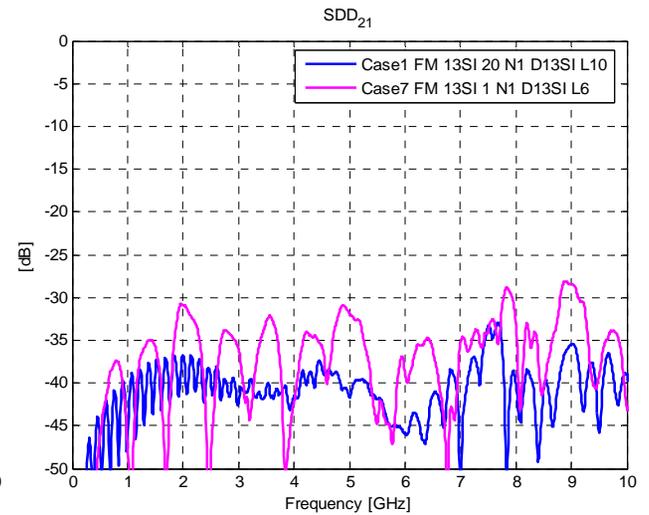

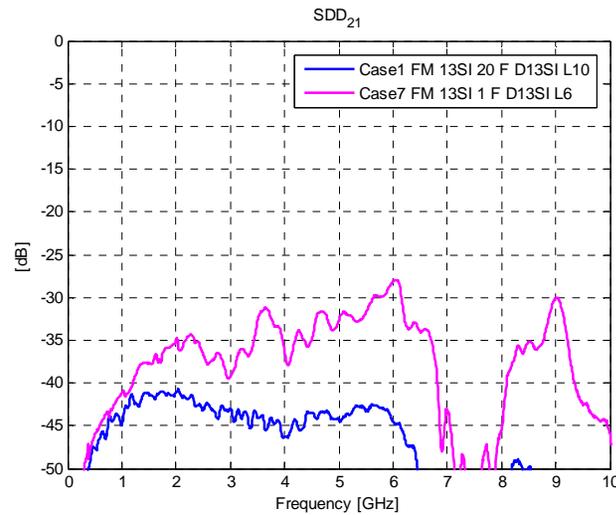

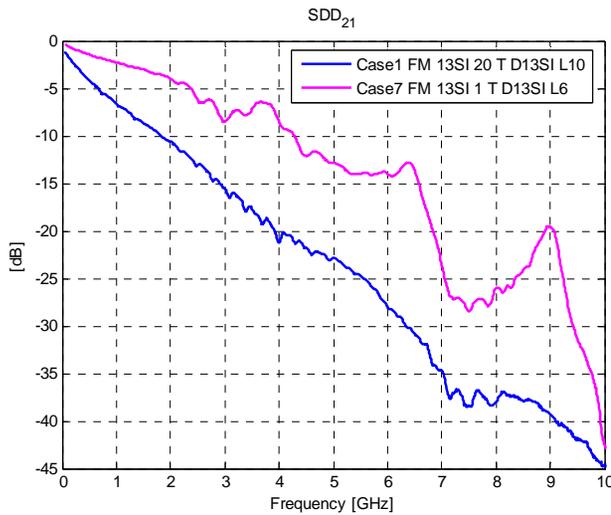

John D'Ambrosia
Tyco Electronics

Rich Mellitz
Intel

Comparison of Performance

- Shared path between aggressors and victims
- 2 connectors
- "l" represents total length

Reality Check

- Length Distribution
 - Case 1 – 40 inches
 - Case 7 -13 inches
- Reality of this variation for links
 - For aggressors / victims originating at same connector and terminating at different cards – yes
 - For aggressors / victims originating and terminating at the same line cards in similar aggressor / victim relationship – not preferred to no
- However, victims / aggressors originating at different line cards and terminating at the same fabric in victim / aggressor pattern
 - only share 1 connector
 - What does the xtalk of a shared single connector net look like from a crosstalk perspective?

ATCA Test Channels

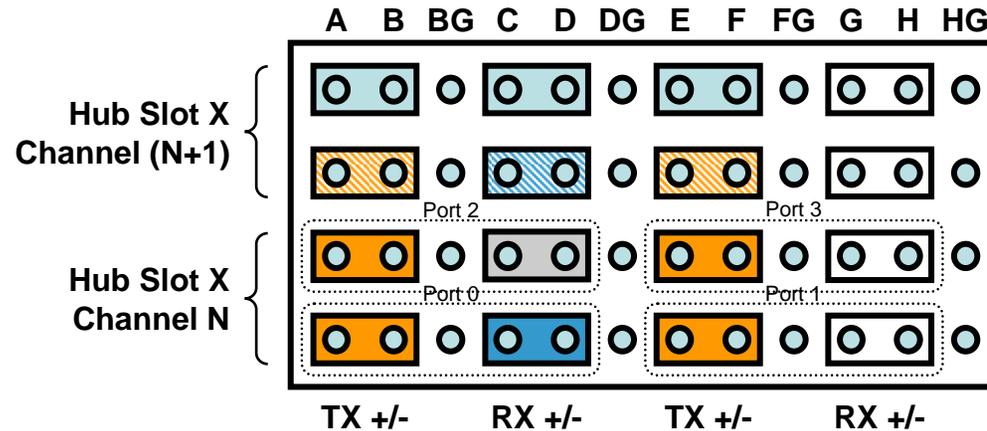

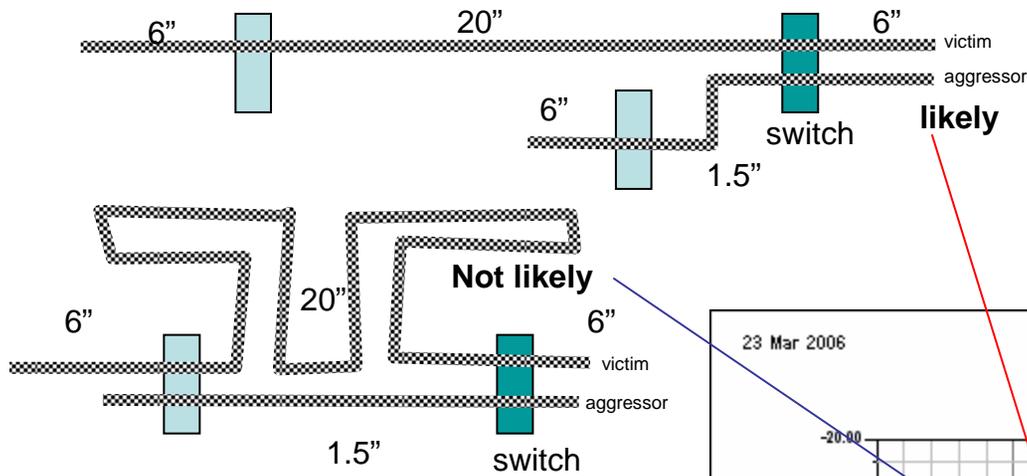

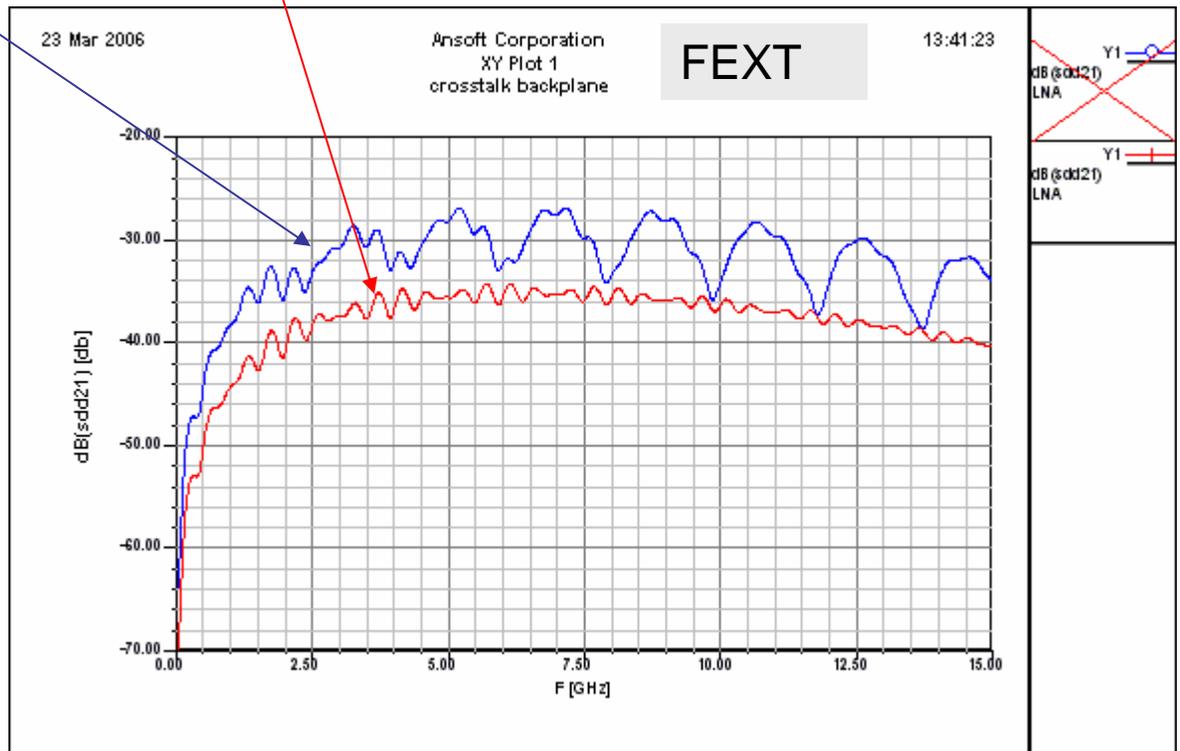

Figure provided by Adam Healey

- For ATCA, a “channel” consists of a total of 8 pair.
- Previous data for ATCA needs to be revisited
 - All FEXT data came from nets that shared two connectors at line card / fabric or assumed both FEXT aggressors shared two connectors at line card / fabric.
 - Two connector FEXT aggressors only true for nets within the same “channel”

Synthesized comparison

8 dB difference

EITsimulations.pdf channel report

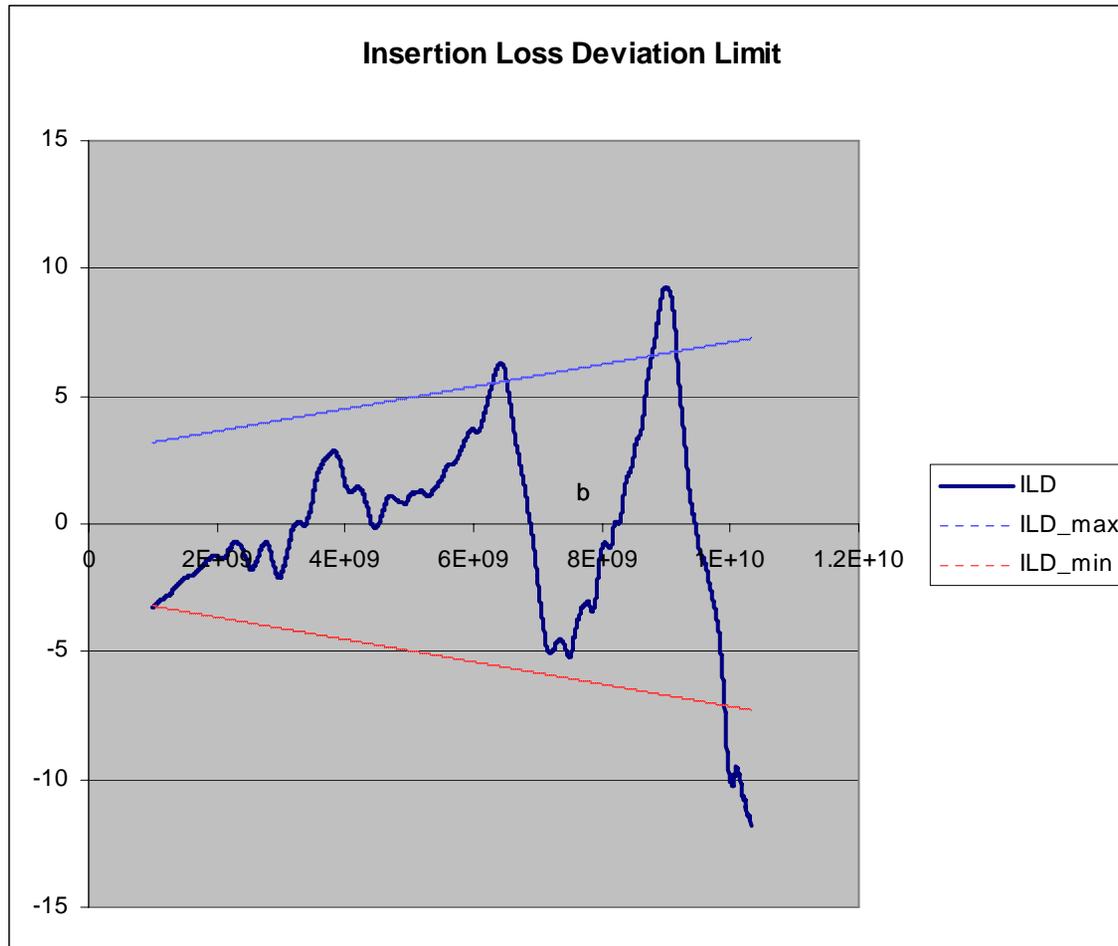

Channel/Test	ICR	ILD	IL	Acceptable Eye Opening at Slicer (with 2 different methods)
TYCO 7	fail	fail	pass	fail
m_82_ripple_90	fail	pass	pass	fail
m_60_ripple_98	fail	pass	pass	fail

Conclusions

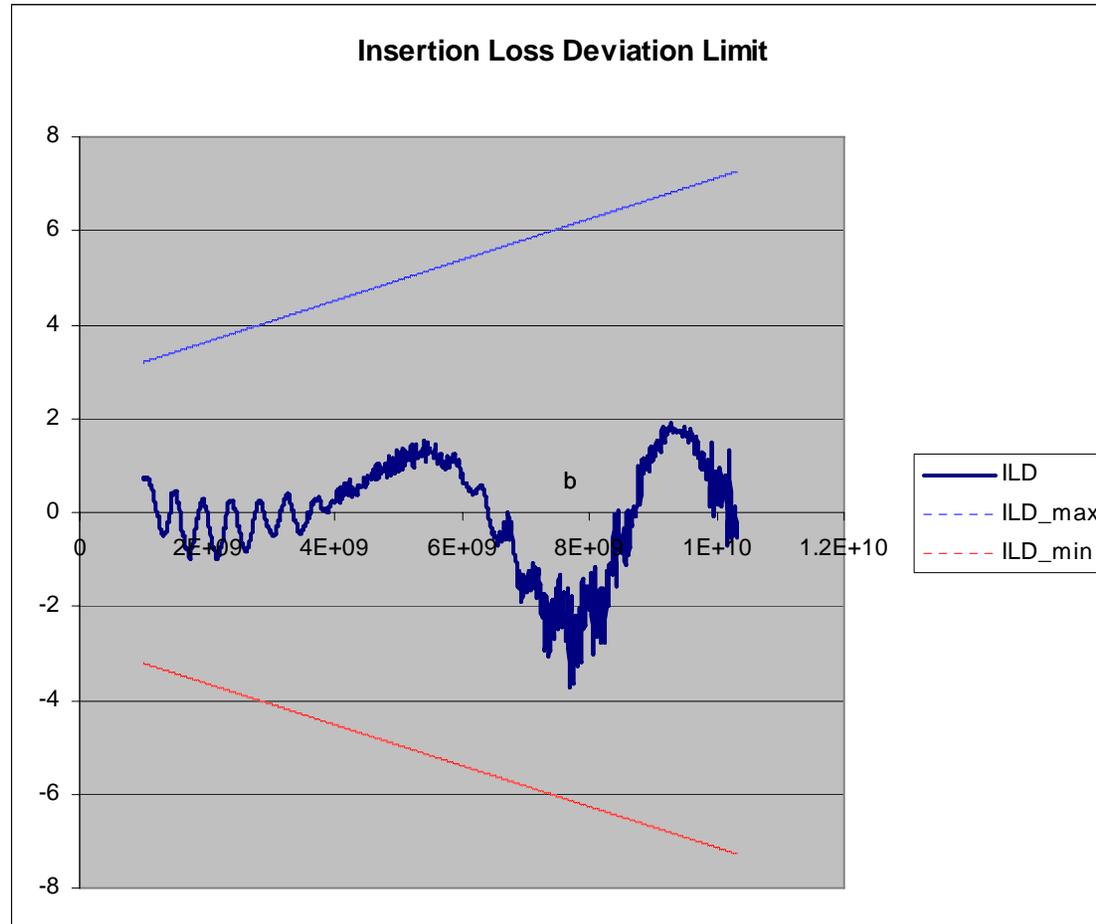

- ATCA FEXT data usage needs to be revisited.
- Proposal to use Tyco Case#7 should be replaced with Intel B1 or M1 case
 - Case 7 is a near top layer
- Proposal to use Tyco Case#7 with m_82_ripple_90
 - Will artificially inflate required SDD21
- Consider adding constraint that will keep forward channel response of victim and aggressors to similar or constrained difference
- Consider using channel sets that are marginally working
