**Editor's comment :
SRS spec and SRS test are linked. SRS testing can be a complex trade off of practicality and rigour, and is for further study and optimization in the task force.

- An example: Expected SRS for worst case Tx and channel is [Tx $\mathrm{X}_{\text {OMA@TDP }}-I L-M N P-R I N p e n, ~-~ M P N p e n ~-~$ Xpen] $=-5.6 \mathrm{dBm}$ with VECP $=3.9 \mathrm{~dB}$, based on Petrilla_1_1212 with a stressed eye with worst case jitter and VECP; module Rx output must meet the target $Q$ of 3.89 and appropriate error statistics

## Link characteristic TBDs

| Parameter | Unit | Name | Formula/notes | Strawman |
| :---: | :---: | :---: | :---: | :---: |
| Power Budget | dB | PB | Value from Petrilla_1_1212 | $8.2^{1}$ |
| Operating Range | m |  | Value from Petrilla_1_1212 | 106 |
| Channel insertion loss | dB | IL | Value from Petrilla_1_1212 | $1^{1.9^{*}}$ |

- Note 1: the power budget is 'min Tx OMA at max TDP' minus the unstressed receiver sensitivity at $5 \times 10^{-5}$
- *Channel insertion loss = cable loss +1.5 dB connection \& splice loss
