The IEEE-SA Standards Style Manual 13.3.2 says "An em dash (--) should be used to indicate the lack of data for a particular cell in a table."
Comment #29 against P802.3bt D2.4 was: "Several tables in Clause 145 have blank cells in the min or max columns, which should contain an em-dash", but this was rejected with the rebuttal:
"The lack of em-dashes is intentional. The em-dash would convey that there is no relevant information, while the lack of the em-dash conveys that there is no specific number."
This makes no sense.
The first example of this issue is in Table 145-7. "Connection check to detection time" Tcc2det has a maximum value of 0.4 s, but the min column is blank. According to the IEEE style manual the cell should contain an em dash, which would indicate that there is no minimum requirement for this time. If there is some requirement on the minimum (not just a number) then an indication of this should be made via an entry in the cell such as "See 145.x.x". If this is not the case, then the cell should contain an em dash.

SuggestedRemedy

Make sure all tables have an entry of em-dash or pointer to the requirement in currently blank min or max columns.
In particular, Tables 145-7, 145-8, 145-9, 145-10, 145-14, 145-16, 145-20, 145-27, 145-28, 145-30, 145-31, 145-32.

Cl **30**   *SC* **30.9.1.1.1**   *P* **35**   *L* **11**   # i-3
Anslow, Peter   Ciena Corporation

Comment Type **E**   *Comment Status* **D**   *Editorial*

aPSEAdminState is 30.9.1.1.2 not 30.9.1.1.1 (the editing instruction is correct in this respect).
Same issue for what is shown as 30.9.1.1.2 through 30.9.1.1.8

SuggestedRemedy

Re-number 30.9.1.1.1 through 30.9.1.1.8 to be 30.9.1.1.2 through 30.9.1.1.9

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT.

Cl **30**   *SC* **30.9.1.1.10**   *P* **37**   *L* **47**   # i-4
Anslow, Peter   Ciena Corporation

Comment Type **E**   *Comment Status* **D**   *Editorial*

Firstly, is confusing to have nested editing instructions.
Secondly, when 30.9.1.1.10 is deleted, what was previously 30.9.1.1.11 becomes 30.9.1.1.10.
There are examples of this situation in previously published amendments. See IEEE Std 802.3bj-2014 subclause 69.1.2

SuggestedRemedy

Change the editing instruction on page 35, line 9 to "Change 30.9.1.1.2 through 30.9.1.1.9 as follows:"
Leave the "Delete" editing instruction on page 37, line 47 as it is.
Add an editing instruction for "aPSEMPSAbsentCounter" of: "Change 30.9.1.1.10 (re-numbered from 30.9.1.1.11 by the deletion of 30.9.1.1.10 above) as follows:"
Renumber the heading for "aPSEMPSAbsentCounter" to 30.9.1.1.10

Yseboodt, Lennart   Philips Lighting

Comment Type **TR**   *Comment Status* **X**   *Unbalance*

A PD's diode bridge is the dominant, and most unpredicatable, contributor to pair-to-pair current unbalance.
Diode specifications generally do not include information or guarantees about the maximum spread in forward voltage between samples.
This makes it hard to get to a provable correct design that will always meet the current unbalance spec.
It is however not impossible, analysis over the course of this project has shown that diode forward voltage differences of more than 60mV are extremely rare. This number has been used to calculate the unbalance budget for the PD.

What isn't taken into account is diode aging. As diodes are exposed to current and temperature, their forward voltage will begin to drift.
A pair of parallel diodes exposed to roughly the same current may be expected to age in the same way (this is uncertain, but let's accept it for the moment).

If 4-pair PSEs are allowed to provide power in polarity configurations that can result in ONE pairset having the other polarity between two PSEs,
this would mean that a PD that has been exposed to a certain current configuration, would find itself powered in a way that has one 'aged' diode conduct, and another 'new' diode in parallel. By 'new' I refer to a diode that has not seen any significant current over it's lifetime.

At the moment of writing this comment, it is unknown what the magnitude of this issue is. Test to determine this are planned.

SuggestedRemedy

1. Quantify this issue for the November meeting
2. Appropriate solition, if needed to be presented then

Clause 33 in the base standard, subclause 33.5 says:
"If the PSE is implemented with a management interface described in 22.2.4 or 45.2 (MDIO), then the management access shall use the PSE register definitions shown in 33.5.1. Where no physical embodiment of the Clause 22 or Clause 45 management is supported, equivalent management capability shall be provided. Managed objects corresponding to PSE and PD control parameters and states are described in Clause 30."

Clause 145 will not define these specific registers, as implementors choose to use a different interface than MDIO to configure the PSE.
We should however maintain the requirement that certain basic parameters in the state diagram must be configurable by the implementor of the PSE.

SuggestedRemedy

Adopt yseboodt_05_0917_management.pdf

Proposed Response   *Response Status* **W**

The PSE state diagram currently requires a PSE to either turn on, or go back to IDLE
within Tpon referenced at the end of detection.
Another option is to 'renew' Tpon by checking is the PD is drawing a correct mark current.
This flexibility has a number of use cases as explained in
http://www.ieee802.org/3/bt/public/may17/lukacs_01_0517_Mark&Hold_rev1.0.pdf

Yseboodt, Lennart   Philips Lighting

Comment Type **TR**   *Comment Status* **X**   *PSE Power*

While this is not entirely unambiguous, the spec today requires a PSE to support at least Class 3, due to the PType(min) parameter having a value of 15.4W. The historic reason for this is that classification was optional and not well understood. By requiring at least support for Class 3, the situation was avoided that a PD was plugged in a nothing ever happened (eg. because it is a Class 1 only PSE).

The situation has now changed:
- Classification is mandatory
- The concept of Classes is much more prevalent in the standard
- The Ethernet Alliance logo program uses Class in the logo to make it clear what kind of PSE is needed to power a particular PD

There are valid use-cases for Class 1 and Class 2 only PSE ports, for which it is currently unclear if these are compliant or not.
Per the same logic, Type 4 PSEs should then be allowed to support only Class 7.

SuggestedRemedy

Change Table 145-16, Item 13:
- minimum value of Type 3 from 15.4 to 4
- minimum value of Type 4 from 90 to 75

Proposed Response   *Response Status* **W**

Yseboodt, Lennart   Philips Lighting

Comment Type **T**   *Comment Status* **X**   *PSE Power*

KTran_lo, the minimum peak PSE voltages for Type 3, Class 6 and Type 4, Class 8 are 46.2 V and 48.05 V respectively.
If these values are used to calculate VTran_lo-2p in the PD under worst case circumstances, the calculated PD voltages are 37.2V and 34.5V.
This mismatches with the VTran_lo-2P specification in Table 145-28 which is 36V.

Proposed is to change the KTran_lo spec to something that results in 36V on the PD side. Otherwise we might get into Von/Voff PD issues.

Quoted text should follow this proposal.
"A PSE shall maintain an output voltage no less than KTran_lo below VPort_PSE-2P min for transient conditions
lasting more than 30 us and less than 250 us, and meet the requirements of 145.2.8.8. Transients less than 30 us in duration may cause the voltage at the PI to fall more than KTran_lo."

SuggestedRemedy

We can rename KTran_lo to VTran-2P, it is obvious it is the low transient voltage, because a minimum is specified.

    Change item 3 in Table 145-16 from KTran_lo to VTran-2P.
    VTran-2P for Type3 is 45.3V (MIN)
    VTran-2P for Type4 is 49V (MIN)
    Change 'parameter' to read: "Output voltage during transient".

    Change text in 145.2.8.3 to:
    "A PSE shall maintain an output voltage no less than VTran-2P for transient conditions lasting more than 30 us and less than 250 us, and meet the requirements of 145.2.8.8. Transients less than 30 us in duration may cause the voltage at the PI to fall below VTran-2P."

    Change parameter name in Table 145-28, item 2 from VTran_lo-2P to VTran_PD-2P.

Yseboodt, Lennart   Philips Lighting

Comment Type **TR**   *Comment Status* **D**   *PSE Power*

TOPIC: and/or
The Chicago Manual of Style says the following about the use of 'and/or':
"Avoid this Janus-faced term. It can often be replaced by 'and' or 'or' with no loss in meaning.
Where it seems needed, try 'or ... or both'. But also think of other possibilities."

"V Noise , the specification for power feeding ripple and noise in Table 145-16, shall be met for common-mode and/or pair-to-pair noise values for power outputs from (I Hold max x V Port_PSE-2P min) to the maximum power per the PSE's assigned Class for PSEs at static operating V Port_PSE-2P."

The use of and/or in this sentence is particularly bad as it allow TWO interpretations of the shall.
ALSO - we are using a lot of words to redundantly indicate this shall applies at any power level.

SuggestedRemedy

"V Noise , the specification for power feeding ripple and noise in Table 145-16, shall be met for common-mode and pair-to-pair noise values at static PSE output voltage."

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

"V Noise, the specification for power feeding ripple and noise in Table 145-16, shall be met for common-mode and pair-to-pair noise values at all static PSE output voltages."

"A minimum current of I Con-2P-unb over one of the pairs of the same polarity under maximum unbalance condition (see 145.2.8.5.1) in the POWER_ON state."

The unbalance specification is tied together by ICon-2P-unb which serves 3 distinct roles:
- It is the minimum current a PSE must be able to supply on a pairset
- It is the maximum current a PSE may source when connected to a worst-case unbalance cable + PD
- It is the maximum current a PD may draw when connected to a worst-case unbalance cable + PSE

That makes it that there is ZERO margin between PSE minimum and PD maximum.

SuggestedRemedy

Adopt yseboodt_03_0917_unbalancemargin.pdf which aims to create margin by introducing a new parameter that takes the role of specifying the minimum current a PSE must support on a pairset.

Yseboodt, Lennart   Philips Lighting

Comment Type **TR**   *Comment Status* **D**   *Unbalance*

"I Peak-2P-unb , defined in Equation (145-12), is the minimum current due to unbalance effects that a PSE supports on a pairset when powering a single-signature PD over 4 pairs."

What follows is a set of equations that define the value of IPeak-2P-unb as function of IPeak (which in turns depends on VPSE and RChan) and RChan-2P.

See: http://www.ieee802.org/3/bt/public/mar17/yseboodt_02_0317_ipeak2punb.pdf
The value of IPeak-2P-unb is often lower than that of ICon-2P-unb. The PSE needs to support ICon-2P-unb, so this has the effect of 'clipping' IPeak-2P-unb to be at least ICon-2P-unb.

The real issue arises in the PD section, where we require a PD never to draw more than IPeak-2P-unb on any given pair.
If that is a requirement (and it should be), then we can't have IPeak-2P-unb depend on VPSE and RChan, both parameters the PD knows nothing about.

Given that there is almost no gain for PSEs to be had from being able to tune IPeak-2P-unb, the most effective solution is to make IPeak-2P-unb a fixed number.

SuggestedRemedy

- Replace page 158, lines 12 through 44 by:

IPeak-2P-unb = {ILIM-2P - 0.002

Comment Type **TR**   *Comment Status* **X**   *Pres: Darshan3*

Table 145-17 contains the values needed to determine Rload, which is the load with which
PSE unbalance is checked.
Calculations show that when plugging in these numbers, some of the Classes fail to meet
ICon-2P-unb.
Eg, with an RPSE_min=0.3 ICon-2P-unb for Class 7 (low channel conditions) is not met:

Class 7, low channel conditions, iport=1.195 i=0.784/0.412/0.784/0.412, VSupply=52.370
VPSEPI=52.003
   RPSE_min = 0.250 and RPSE_max = 0.446
   PPD = 62.0, VLoad = 51.08, Vpd[1-4] = 52.11 52.14 0.26 0.23 = 51.92
   FAILS to meet ICon-2P-unb of 0.781

Other values of RPSE cause more errors, but all in Class 7.

SuggestedRemedy

Either we need to update ICon-2P-unb, or we need to update the values in Table 145-17.
Input Yair is needed.

"The minimum value of I Inrush-2P includes the effect of end to end pair to pair resistance unbalance when operating over 4 pairs."

Seems like a leftover sentence from earlier inrush specification. There are only min values defined (for IInrush-2P) for dual-signature, where unbalance does not play a role.

SuggestedRemedy

Remove sentence.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT.

Cl **145**   *SC* **145.2.8.6**   *P* **162**   *L* **32**   # i-119
Yseboodt, Lennart   Philips Lighting

Comment Type **TR**   *Comment Status* **X**   *PSE Inrush*

"The minimum inrush requirement is a function of the pairset voltage and is as follows:
a) During POWER_UP, for pairset voltages between 0 V and 10 V, the minimum I Inrush-2P requirement is 5 mA.
b) During POWER_UP, for pairset voltages between 10 V and 30 V, the minimum I Inrush-2P requirement is 60 mA.
c) During POWER_UP for pairset voltages above 30 V, the minimum I Inrush-2P and I Inrush requirement are as defined in Table 145-16."

I guess what we want to say is that these minimum capabilities apply for each powered pairset in POWER_UP.

SuggestedRemedy

Replace quoted text by:

"The minimum Iinrush and IInrush-2P current capability as defined in Table 145-16 applies when VPSE exceeds 30V.
During POWER_UP, the minimum supported current on each powered pairset is:
- 5mA when 0V < VPSE <= 10V
- 60mA when 10V < VPSE <= 30V"

Proposed Response   *Response Status* **W**

TFTD

How can this be both the Iinrush and Iinrush-2P minimum? The original sentence quotes pairset voltage and thus implies this is per pairset…

Comment Type **TR**   *Comment Status* **X**   *PSE Power*

"When connected to a single-signature PD, the PSE should remove power from both pairsets before the current exceeds the "PSE upperbound template" on either pairset."

Let's say we have a PD (Class 5-8) that is operating in 4-pair mode, something occurs on one pairset only and the PSE flips to 2-pair mode.
Per Equation 145-8, the PSE is now required to support the full assigned power over 2-pairs. Not something we really want.

We can fix this by re-assigning the PD to Class 4 in case of a flip to 2-pair. That way we don't violate ICable by delivering more power over 2-pair.

SuggestedRemedy

- Add the following statement to SEMI_PWRON_PRI and SEMI_PWRON_SEC:
"pse_allocated_pwr = min(pse_allocated_pwr, 4)"

Credit to Ken Bennet for finding this issue.
See bennet_01_0917_vmarkth.pdf for full problem description.

Short summary: There is no mention in our spec that a PD should implement hysteresis for
V_Mark_th.
Without hysteresis it is possible to get spurious class/mark transitions due to the voltage
drop of around 0.5V caused by the class current.
It is compounded by the PD state diagram listing VMark_Th in the constants section,
implying the value cannot change while the state diagram is running.

SuggestedRemedy

- Move VReset_PD, VReset_Th, VMark_th, VOff_PD, and VOn_PD from the Constants
(145.3.3.3) section to the Variable (145.3.3.4) section.
- Add the following text after the third paragraph in 145.3.6.1.1:
"Appropriate hysteresis in the VMark_th threshold voltage is required to avoid erroneous
transitions between mark and class states when the PSE switches from a class voltage to
a mark voltage or vica versa."

Variable present_det_sig:
"Controls presenting the detection signature (see 145.3.4) by the PD.
　　Values:
　　invalid: A non-valid PD detection signature is to be applied to the PI.
　　valid: A valid PD detection signature is to be applied to the PI over each pairset.
　　either: Either a valid or non-valid PD detection signature may be applied to the
PI."

　　Why does valid say 'over each pairset', but invalid does not ?

SuggestedRemedy

Given that this is single-signature, all of these should apply on both pairsets.
Change to:
"Controls presenting the detection signature (see 145.3.4) by the PD over each pairset.
　　Values:
　　invalid: A non-valid PD detection signature is to be applied to the PI.
　　valid: A valid PD detection signature is to be applied to the PI.
　　either: Either a valid or non-valid PD detection signature may be applied to the
PI."

The variable pd_acs_req indicates if a PD saw a long class event and must do Autoclass.
This variable's description is very misleading in 145.3.3.4, moreover, we don't need it
because we can use "long_class_event * pd_autoclass_enabled" to get the same effect.

I now also notice that Figure 145-27 doesn't work (eg. pd_acs_req is set to FALSE in
IDLE_ACS, preventing it from being true in the arc from IDLE_ACS to WAIT_ACS).

Table 145-20 on valid PD detection signature, first parameter is R_detect.
The parameter name also mentions: "(at any 1 V or greater chord within the voltage range conditions)".

This text comes straight out of 802.3af.
What does it mean ? A resistance is a resistance and it needs to be there between 2.7 and 10.1V per the conditions.
We're on the PD side of the spec, the 1V chord is a requirement on the PSE, but irrelevant for PDs.

SuggestedRemedy

Delete quoted text.

Proposed Response   *Response Status* **Z**

All but a few subclause titles are singular.
145.3.5 = "PD signature configurations"

SuggestedRemedy

Change to "PD signature configuration"

Proposed Response   *Response Status* **W**

PROPOSED REJECT.

The sigular version of the clause title is misleading. It seems that the PD signature is being reconfigured on the fly or something. The plural version implies that there are more than one configuration and this is where to find their descriptions/requirements.

Cl **145**   *SC* **145.3.5**   *P* **183**   *L* **22**   # i-143

Yseboodt, Lennart   Philips Lighting

Comment Type **TR**   *Comment Status* **X**   *PD Signatures*

"A single-signature PD shall present a valid detection signature, as defined in Table 145-20, on a given Mode when no voltage or current is applied to the other Mode, and shall present an invalid detection signature on that Mode when any voltage between 10.1 V and 57 V is applied to the other Mode. These requirements apply to both Mode A and Mode B."

The requirement only holds for corrupting voltages above 10.1V, whereas connection check entirely operates below 10.1V.
See http://www.ieee802.org/3/bt/public/may17/yseboodt_09_0517_signature.pdf for problem description.

SuggestedRemedy

Change first paragraph of 145.3.5 to read:
"A single-signature PD shall present a valid detection signature, as defined in Table 145-20, on a given Mode when no voltage or current is applied to the other Mode, and shall not present a valid detection signature on that Mode when any voltage between 3.7 V and 57 V is applied to the other Mode. These requirements apply to both Mode A and Mode B.
NOTE - A detection signature is only considered valid when it meets Table 145-20 over the entire PD detection voltage range of 2.7 to 10.1 V."

Yseboodt, Lennart   Philips Lighting

Comment Type **TR**   *Comment Status* **X**   *PD Reset*

In Table 145-26, Item 6, we find V_Reset_PD which is a range between 0V and 2.81V.
The additional information points to 145.3.8.1, which says nothing about this parameter.

VReset_PD isn't mentioned abywhere in the document, with the exception that it is used in
the state diagram.
Specifically, there is a global arc into IDLE with VPD < V_Reset_PD * other_conditions.

Because V_Reset_PD is a range, consistent with other parameters that are a range, this
means the PD can choose any voltage between 0V and 2.81V and use this as the reset
threshold.
This is wrong - the PD should return to IDLE and stay there whenever the voltage is less
than 2.81V.

SuggestedRemedy

- Change the definition of VReset_PD in 145.3.3.3 to read as follows:
"VReset_PD max: The maximum PD reset voltage (see Table 145-26).
- Change all occurences of "VReset_PD" to "VReset_PD max" in the state diagrams in
145.3.3.7
- Change the additional information in Table 145-26, item 6 to read "See 145.3.6.1" (PD
Multiple-Event class signature)
- Append a paragraph to 145.3.6.1 that reads as follows:
"V_Reset_PD, as defined in Table 145-26, is the voltage range in which the PD transitions
to IDLE, thereby resetting the class event count."
- Make the same changes for dual-signature as appropriate.

Proposed Response   *Response Status* **W**

TFTD

From page 186, line 48: VReset_th is the PI voltage threshold at which the PD transitions
from a DO_MARK_EVENT state to IDLE
as shown in Figure 145–26 and Figure 145–28.

That being the case, shouldn't we use Vreset_th since that is when the PD actually goes
back to IDLE? However, the transition from IDLE to DO_DETECTION is then based on
Vreset_PD which makes sense. So you may instantaneously transition through IDLE to
detection…

Cl **145**   *SC* **145.3.8**   *P* **187**   *L* **1**   # i-154
Yseboodt, Lennart   Philips Lighting

Comment Type **ER**   *Comment Status* **D**   *Editorial*

Table 145-28, the big PD Table, nearly every parameter has the value specified 'per the
assigned Class'.
Exceptions: V_Tran_lo-2P, Voverload-2P, Tinrush_PD, Tdelay-2P, Islewrate,VNoise_PD,
Von_PD, Voff_PD, TClass_PD, and Vbfd.

All of the exceptions apply to both Type 3 and Type 4.
All of the others are determined by Class.

We don't need the PD Type column in this Table at all, it doesn't tell us anything new, nor
has it any technical significance.

SuggestedRemedy

Remove PD Type column from Table 145-28.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT.

Variable naming convention in the DLL section has lost cohesion due to many changes.
There is a mix of CamelCase, lower_case_underscore, AND_ALL_CAPS.

Specifically, the use the ALL_CAPS variable names can lead to confusion with state
names when they are used in text.

SuggestedRemedy

Rename DLL variables per the following rules, for Clause 145 only:
- Use CamelCase for variables linked to Clause 30 objects
- Use lower_case_underscore for DLL state diagram internal variables and constants

This will mostly affect the ALLCAPS variables that will be turned into lowercase.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

"During normal operation, the PSE is in the RUNNING state. If the PSE wants to initiate a change in the PD
allocation, the local_system_change is asserted and the PSE enters the PSE_POWER_REVIEW state, where
a new power allocation value, PSE_NEW_VALUE, is computed. If the PSE is in sync with the PD or if
PSE_NEW_VALUE is smaller than PSEAllocatedPowerValue, it enters the MIRROR_UPDATE state
where PSE_NEW_VALUE is assigned to PSEAllocatedPowerValue. It also updates PDRequestedPowerValueEcho and returns to the RUNNING state.
If the PSE's previously stored MirroredPDRequestedPowerValue changes, a request by the PD to change its
power allocation is recognized. It entertains this request only when it is in sync with the PD. The PSE
examines the request by entering the PD_POWER_REQUEST state. A new power allocation value,
PSE_NEW_VALUE, is computed. It then enters the MIRROR_UPDATE state where PSE_NEW_VALUE
is assigned to PSEAllocatedPowerValue. It also updates PDRequestedPowerValueEcho and returns to the
RUNNING state."

Don't use the word "state" when using state name.

SuggestedRemedy

Replace 'the YYY state' by 'YYY'.

Yseboodt, Lennart   Philips Lighting

Comment Type **E**   *Comment Status* **D**   *Editorial*

"During normal operation, the PD is in the RUNNING state. If the PD's previously stored
MirroredPSEAllocatedPowerValue is changed or local_system_change is asserted by the PD so as to change
its power allocation, the PD enters the PD_POWER_REVIEW state. In this state, the PD evaluates the
change and generates an updated power value called PD_NEW_VALUE. If PD_NEW_VALUE is less than
PDMaxPowerValue, it updates PDMaxPowerValue in the PD_POWER_REALLOCATION1 state. The PD
then finally enters the MIRROR_UPDATE state where PD_NEW_VALUE is assigned to
PDRequestedPowerValue. It also updates PSEAllocatedPowerValueEcho and returns to the RUNNING
state.
In the above flow, if PD_NEW_VALUE is greater than PDMaxPowerValue, the PD waits until it is in sync
with the PSE and the PSE grants the higher power value. When this condition arises, the PD enters the PD
POWER_REALLOCATION2 state. In this state, the PD assigns PDMaxPowerValue to
PDRequestedPowerValue and returns to the RUNNING state."

Do not use the word "state" when state names are used.

SuggestedRemedy

Replace 'the YYY state' by 'YYY'.

"for all specified frequencies", The frequency range in Table 33-20b exceeds the frequency requirements for 2.5GBASE-T and 5GBASE-T and may be reduced. (same change in 145.4.9.2.4 in another comment))

While we were trying to manage simplicity with too many midspan variations, we gave the midspan Cat 6a connector PSANEXT requirements for 2.5G/5GBASE-T. This isn't an error, but more style. A more inclusive specification would only have the required frequencies.

SuggestedRemedy

In 33.4.9.2.4: delete "for all specified frequencies"
insert "For other than 5GBASE-T or 10GBASE-T operation, PSANEXT loss for Midspan PSE devices shall meet the values determined by Table 33-20b from 1 MHz to 100 MHz. For 5GBASE-T capable midspans, PSANEXT loss for Midspan PSE devices shall meet the values determined by Table 33-20b from 1 MHz to 250 MHz. For 10GBASE-T capable midspans, PSANEXT loss for Midspan PSE devices shall meet the values determined by Table 33-20b from 1 MHz to 500 MHz."

Picard, Jean   Texas Instruments Inc

Comment Type **TR** *Comment Status* **X**   *PSE Power*

The following sentence does not make sense. In reality the PSE cannot really short the PI voltage, all it can do is temporarily turn off its port (it's only a low side switch after all, with a 0.1uF cap).

"The minimum PD input capacitance CPort min or CPort-2P min defined in Table 145-28, allows a PD to operate for input voltage transients which cause VPD to drop as low as 0 V, lasting less than 30 us as specified in 145.3.8.6."

SuggestedRemedy

Use similar wording to the "at" standard, removing "which cause VPD to drop as low as 0 V".
The wording becomes this:
"The minimum PD input capacitance CPort min or CPort-2P min defined in Table 145-28, allows a PD to operate for input voltage transients lasting less than 30 us as specified in 145.3.8.6"

In the variable option_probe_alt_sec definition:
"option_probe_alt_sec
This variable indicates if the PSE will continue to detect and conditionally class on the Secondary Alternative in the event an invalid detect or class result is found on the Primary Alternative. This variable applies to CC_DET_SEQ = 3.
Values:
FALSE: PSE does not probe the Secondary Alternative if an invalid signature is found on the Primary Alternative.
TRUE: PSE does probe the Secondary Alternative if an invalid signature is found on the Primary Alternative." we have few issues:
1) The definition text says "in the event an invalid detect or class result is found" is not reflected in the text that defines the TRUE and FALSE. Only the "invalid detection" is addressed.
2) The text " if an invalid signature is found" in the TRUE and FALSE definition is not logically accurate and can lead to wrong interpretation. It should be " if an invalid signature will be found" since this variable can be set in system config phase or on the fly, but the current definition may be interpreted as this parameter can be configured only on the fly as function of the result of primary detection signature result if valid or not."

SuggestedRemedy

Change the TRUE and FALSE definition from:
"FALSE: PSE does not probe the Secondary Alternative if an invalid signature is found on the Primary Alternative.
TRUE: PSE does probe the Secondary Alternative if an invalid signature is found on the Primary Alternative."
To:
"FALSE: PSE does not probe the Secondary Alternative if an invalid detection signature or classification will be found on the Primary Alternative.
TRUE: PSE does probe the Secondary Alternative if an invalid detection signature or classification will be found on the Primary Alternative"

In Figure 145-16, in the exit from ENTRY_SEC to START_DET_SEC, when selecting
CC_DET_SEQ 0 or 1, and class_4PID_multi_event_sec = FALSE, the secondary state
machine allows to move from ENTRY_SEC state to START_DETECT_SEC only if
pwr_app_pri = TRUE per the existing condition:
sism * (!class_4PID_mult_events_sec * pwr_app_pri) + class_4PID_mult_events_sec) *
(CC_DET_SEQ=0 + CC_DET_SEQ=1)

If Primary fails to powerup, the Primary state machine returns back to IDLE_PRI. As a
result, pwr_app_pri variable will remain in FALSE, and the secondary state machine won't
be able to exit from ENTRY_SEC i.e. will be stuck there.
The easy way to handle this problem is to enable moving to START_DETECT_SEC from
ENTRY_SEC, also if primary performed detection at least once and is now in IDLE_PRI
state which prevents stuck at ENTRY_SEC. This solution requires the addition of new
variable det_once_pri (the current draft has only det_once_sec) which is required also by
other comments that all related to each other and can be see in darshan_04_0917.pdf. "

SuggestedRemedy

See darshan_04_0917.pdf for how the following change is also addresses other issues
including the possibility to do cycles of detection + class_probe events on primary and
secondary with the option to go to IDLE_PRI/SEC and WAIT_PRI/SEC.
----
1) Add the following variable:
det_once_pri
This variable indicates if the PSE has probed the Primary Alternative at least once, when
entering to DETECT_EVAL_PRI. Values:
FALSE: The PSE has not probed on the Primary Alternative since entering the Primary
Alternative state diagram.
TRUE: The PSE has probed the Primary Alternative at least once since entering the
Primary Alternative state diagram.
2) Change from:
"sism *((!class_4PID_mult_events_sec * pwr_app_pri) + class_4PID_mult_events_sec) *
(CC_DET_SEQ=0 + CC_DET_SEQ=1)"
To:
sism * ((!class_4PID_mult_events_sec * (pwr_app_pri + det_once_pri * !det_start_pri)) +
class_4PID_mult_events_sec) * (CC_DET_SEQ=0 + CC_DET_SEQ=1)."

Peker, Arkadiy   Microsemi Corporation

Comment Type **TR**   *Comment Status* **X**   *Pres: Darshan13*

In the transition between ENTRY_SEC to START_DET_SEC we have the following
condition:
"sism * ((!class_4PID_mult_events_sec * pwr_app_pri) + class_4PID_mult_events_sec) *
(CC_DET_SEQ=0 + CC_DET_SEQ=1)"
In this condition, when class_4PID_mult_events_sec=FALSE, and CC_DET_SEQ=0 OR 1,
If START_DET_PRI exit to IDLE_PRI due to tdet_timer_pri_done, the pwr_app_pri will
remain in FALSE which won't allow exiting from ENTRY_SEC to START_DETECT_SEC
and the secondary state machine remain stuck in ENTRY_SEC.

The proposed solution for this problem is:
1) To add stop_tdet_timer_pri in the DETECT_EVAL_PRI state. This action ensures that
tdet_timer_pri_done will remain FALSE when moving from START_DETECT_PRI to
DETECT_EVAL_PRI. This modification is required since even if we did detection before
tdet_timer_pri is expired, we will get tdet_timer_pri_done anyway. This action will enables
the usage of tdet_timer_pri_done in the secondary state machine at the exit from
ENTRY_SEC to START_DETECT_SEC when we will add this variable in (2).
2. To add ""tdet_timer_pri_done to the condition of the exit from ENTRY_SEC to
START_DETECT_SEC as follows:
""sism *((!class_4PID_mult_events_sec * (pwr_app_pri + tdet_timer_pri_done)) +
class_4PID_mult_events_sec) * (CC_DET_SEQ=0 + CC_DET_SEQ=1)"" . This change
will allow to move to START_DETECT_SEC in case that we move from
START_DETECT_PRI to IDLE_PRI due to tdet_timer_pri expiration."

SuggestedRemedy

1. Add "stop_tdet_timer_pri"" to the DETECT_EVAL_PRI state.
2. Add "tdet_timer_pri_done to the condition of the exit from ENTRY_SEC to
START_DETECT_SEC by performing the following change:
Change from:
"sism *((!class_4PID_mult_events_sec * pwr_app_pri) + class_4PID_mult_events_sec) *
(CC_DET_SEQ=0 + CC_DET_SEQ=1)"
To:
"sism *((!class_4PID_mult_events_sec * (pwr_app_pri + tdet_timer_pri_done)) +
class_4PID_mult_events_sec) * (CC_DET_SEQ=0 + CC_DET_SEQ=1)"

Due to the fact that item 2 need additional changes due to other comments, and in order to
meet the requirement that we need single independent comment for each issue which I did
here but may cause editor confusion of how to apply the remedies of other comments, See
darshan_04_0917.pdf for how the above change is combined with other changes i.e. the
possibility to do cycles of detection + class_probe events on primary and secondary with
the option to go to IDLE_PRI/SEC and WAIT_PRI/SEC."

Peker, Arkadiy   Microsemi Corporation

Comment Type **TR**   *Comment Status* **X**   *PSE SD*

This comment is an update to the comment that requires to delete Figure 145B-3:
 Per the definition of CC_DET_SEQ=0 for dual-signature, the detection need to be parallel
and not staggered and this contradicts figure 145B-3 that is shown as one of the staggered
detection versions. So we have two options to resolve this:
a) To delete figure 145B-3 to sync with CC_DET_SEQ=0 definition for dual-signature PDs
and also update state machine which will be complicated task at this point of time. OR,
b) (Preferred) Keep Figure 145B-3, and change the ""CC_DET_SEQ=0 definition that to
allow staggered detection in addition to parallel detection which currently is supported by
the state machine."

SuggestedRemedy

Change "Connection Check is followed by staggered detection for a single-signature PD
and parallel detection for a dual-signature PD."
To: Connection Check is followed by staggered detection for a single-signature PD and
parallel or staggered detection for a dual-signature PD."

Proposed Response   *Response Status* **W**

TFTD

These variables do something in the state diagram (control which branches to take), so I
don't think we can just change the definition of option "0" unless "0" really has both
staggered and parallel. Does it?

In the exit from IDLE_SEC to START_DETECT_SEC we have the following condition:
"(!pwr_app_sec * pwr_app_pri) + ((CC_DET_SEQ=3) * option_probe_alt_sec *
!det_start_pri * !det_once_sec)"
Based on the description in page 109 lines 37-38 for CC_DET_SEQ and specifically,
CC_DET_SEQ=3 for dual-signature means: Connection check is followed by staggered
detection
(The analysis and simulations results for other sequences 0, 1 and 2 are covered by other
comments and most of them are OK).

The staggered detection range may occur with starting the secondary detection after doing
the primary detection (option 1) up to doing the secondary detection only if the primary is
on (option 2). This covers the full range of possibilities.
Option 1 is normally used when class_4PID_mult_events_sec=TRUE. This currently is not
covered by the state machine.
Option 2 is normally used when class_4PID_mult_events_sec=FALSE and it is covered in
the 1st part of the condition: (!pwr_app_sec * pwr_app_pri).
Option 3 is covers the case that the primary return to IDLE_PRI due to various reasons
and the secondary didn't detect even once: ((CC_DET_SEQ=3) * option_probe_alt_sec *
!det_start_pri * !det_once_sec).

The current state diagram covers option 2 and 3, and does not cover option 1!

The state diagram should allow staggered detection before Primary power up, after primary
power up, and during power up in case that class_4PID_mult_events_sec is set to FALSE.
The proposed changes in the state diagram will allow staggered detection after Primary
finished its 1st detection without affecting the previous functionality and flow, by oring the
additional missing possibility (option 1).
The proposed changes do not affect:
a) The behavior of other "CC_DET_SEQ NE 3" flows.
b) Previous state diagram possibilities.

In addition, the proposed changes also required to cover multiple cycles of
detection+classification until host decides to power on the port (which is covered by
darshan_04_0917.pdf).
The additional missing possibility is covered by adding the following part:
+ (class_4PID_mult_events_sec*(CC_DET_SEQ=3) * !det_once_sec * det_once_pri)
In order to implement the addition, we need to add the following variable for the primary
side (similar variable is already exist for the secondary):

"det_once_pri
This variable indicates if the PSE has probed the Primary Alternative at least once, when
entering to DETECT_EVAL_PRI.
Values:
FALSE: The PSE has not probed on the Primary Alternative since entering the Primary
Alternative state diagram.

TRUE: The PSE has probed the Primary Alternative at least once since entering the
Primary Alternative state diagram."

In the above proposed change, det_once_pri is used as a condition for starting detection in
the secondary any time until power up, after primary was detected at least once.
det_once_pri is set to FALSE when sism = FALSE at ENTRY_PRI.
det_once_pri is set to TRUE when Primary state diagram reaches to
"DETECT_EVAL_PRI", to clearly indicate that detection on primary has ended before
tdet_timer_pri expired."

SuggestedRemedy

1. Change from:
"(!pwr_app_sec *pwr_app_pri) + ((CC_DET_SEQ=3) * option_probe_alt_sec *
!det_start_pri * !det_once_sec)""
To:
"(!pwr_app_sec *pwr_app_pri) + ((CC_DET_SEQ=3) * option_probe_alt_sec *
!det_start_pri * !det_once_sec) +
(class_4PID_mult_events_sec*(CC_DET_SEQ=3) * !det_once_sec * det_once_pri)
2. Add the following variable to the variable list:
det_once_pri
This variable indicates if the PSE has probed the Primary Alternative at least once, when
entering to DETECT_EVAL_PRI. Values:
FALSE: The PSE has not probed on the Primary Alternative since entering the Primary
Alternative state diagram.
TRUE: The PSE has probed the Primary Alternative at least once since entering the
Primary Alternative state diagram.
"

The "Range of maximum class supported" column of table 145-2 is confusing.
Class 8 is not a range, and it suggests that Type 4 PSE only supports Class 8

SuggestedRemedy
Break it to 2 columns for single and dual signature.

Proposed Response   *Response Status* **W**
PROPOSED REJECT.

The reason for the ranges is not single vs. dual signature. It is that 2-pair Type 3 can support class 3 (to replace old type 1 systems), or class 4 (to replace old type 2 systems). Furthermore, 4-pair Type 3 can support a maximum of class 5 (45W) or class 6 (60W). Finally, Type 4 is required to support all classes (up to 8, 90W).

　　The PSEMPSAbsentCounter is only specified for Type 1 and Type 2 state machine
　　references. It is not clear if this was intention or if references to Type 3 and Type 4 should
　　be added.
　　Currently:
　　This counter is incremented when the PSE state diagram (Figure 145-13, Figure 145-
　　15, and Figure 145-16) enters the state ERROR_DELAY, ERROR_DELAY_PRI, or
　　ERROR_DELAY_SEC.

SuggestedRemedy
　　Option 1 Change
　　"transitions directly from the state POWER_ON to the state IDLE due to
　　tmpdo_timer_done being asserted"
　　to
　　"transitions directly from the state POWER_ON, SEMI_PWR_PRI, SEMI_PWR_SEC,
　　POWER_ON_PRI, or POWER_ON_SEC to the state IDLE due to tmpdo_timer_done,
　　tmpdo_timer_done_pri or tmpdo_timer_done_sec being asserted"
　　Option 2 Change
　　"when the PSE"
　　to
　　"when the Type 1 and Type 2 PSE"

PROPOSED ACCEPT IN PRINCIPLE.

Delete ", per the assigned Class" in item 12 on page 154 (comment says page 153).

Cl **145**   *SC* **145.3.1**   *P* **154**   *L* **19**   # i-285

Stewart, Heath   Analog Devices Inc.

Comment Type **TR**   *Comment Status* **X**   *DLL*

Data Link Layer Classification is deemed optional in Table 145-18. However, because a
PSE is _allowed_ to select any one of 4 4PID inspection techniques (see 145.2.6.7), it
logically follows that the PD _must_ exhibit all 4 of the 4PID characteristics.
Notably, the 1st characteristic (single-signature) is enough to prove a PD is 4PID
compatible, thus a single-signature PD need not comply with the remaining 3 attributes.
However, a dual-signature PD has little choice but to comply with all 3 attributes (2-4).
Because the PD does not know which of the aforementioned tests will be performed it
must have all 2-4 attributes in order to receive 4P power.

SuggestedRemedy

Change
Table 145-18, Type 3, Dual, 1 to 3 row :: Data Link Layer Classification column :: from
"Optional" to "Mandatory"
Delete Table 145-18, Note 2
Page 184, Line 3 Change
Single-signature PDs that request Class 4 or higher and dual-signature PDs that request
Class 4 or higher on at least one of its Modes shall provide DLL classification.
to
Single-signature PDs that request Class 4 or higher and dual-signature PDs shall provide
DLL classification.

Proposed Response   *Response Status* **W**

TFTD

Was the intention to let the PSE choose any of the methods?

Cl **145**   *SC* **145.2.8.12**   *P* **165**   *L* **33**   # i-286

Stewart, Heath   Analog Devices Inc.

Comment Type **T**   *Comment Status* **D**   *PSE Power*

145.6.1 states "All equipment subject to this clause shall conform to IEC 60950-1 or IEC
62368-1. In particular, the PSE shall be classified as a Limited Power Source in
accordance with IEC 60950-1 or IEC 62368-1 Annex Q."
However elsewhere in 145, limited power source requirements are redundantly stated. For
many reasons it is normal to avoid redundantly specifying requirements called out in
referenced standards.

SuggestedRemedy

Remove subclause 145.2.8.12
Page 163 Figure 145-25 remove lines related to I_LPS and P_Type,max/V_PSE.
Upperbound template will thus have a value of 1.3A from 4s to infinity.
Page 164 remove lines 21 and 29 (both reference I_LPS)
Page 244 Line 17 Remove PSE82.

Proposed Response   *Response Status* **W**

PROPOSED REJECT.

If we remove this section, the only requirements for max power would be in the "other"
section of clause 145 that people tend to skip over (I know that they are wrong to do so,
but they do). This will lead to "BT" devices on the market that violate LPS and hurt the
PoE brand.

Cl **145** *SC* **145.2.8** *P* **153** *L* **16** # i-291

Stover, David Analog Devices Inc.

Comment Type **TR** *Comment Status* **X** *PSE Inrush*

The PSE inrush requirements "I_Inrush" and "I_Inrush-2P" always apply. However, dual-signature PDs may be powered over one or both pairs. For this reason, specifying total output current (I_Inrush) for dual-signature PDs is problematic. For example: When a single pairset of a Type 4/Class 5 dual-signature PD is inrushed, the PSE shall provide an I_Inrush of at least 0.65A and shall not provide an I_Inrush-2P of more than 0.6A. For dual-signature PDs, output current during inrush should only be specified per-pairset.

SuggestedRemedy

Remove I_Inrush entries for dual-signature PDs.

This is a general comment regarding Intellectual Property.
The use of PoE has been the subject of multiple litigations from NPEs (Non Practicing Entities), otherwise known as "Patent Trolls".
Two in particular, Chrimar Systems and Network 1, have litigated against a significant group of companies in the Ethernet industry who ship products that implement PoE.
Since 802.3bt increases the available power, this will no doubt attract new companies to utilize PoE in many new applications.
What assurances have been made by companies who believe they have intellectual property that relates to 802.3bt (by at least Chrimar Systems and Network 1), such that licensing under RAND terms can be secured?

SuggestedRemedy

Issue a much stronger warning indicating the use of 802,3bt may result in alleged infringement of Intellectual Property,

Proposed Response   *Response Status*   **W**

PROPOSED REJECT.

The process for requesting an LOA for the IEEE P802.3bt project has been followed in respect to the two holders of potentially essential patent claims named in this comment, as well as for all other holders of potentially essential patent claims identified during this project.

The IEEE is not responsible for: (a) identifying Essential Patent Claims for which a license may be required; (b) determining the validity, essentiality, or interpretation of Patent Claims; or (c) determining whether any licensing terms or conditions provided in connection with submission of a Letter of Assurance, if any, or in any licensing agreements are reasonable or non-discriminatory; or (d) determining whether an implementation is a Compliant Implementation. See subclause 6.2 'Policy' of the IEEE-SA Standards Board Bylaws <http://standards.ieee.org/develop/policies/bylaws/sect6-7.html#6.2>.

Discussion or other communications regarding: (a) the status or substance of ongoing or threatened litigation; and (b) the essentiality, interpretation, or validity of Patent Claims; is prohibited during IEEE-SA standards-development meetings or other duly authorized IEEE-SA standards-development technical activities. See subclause 6.2 'Policy' of the IEEE-SA Standards Board Bylaws <http://standards.ieee.org/develop/policies/bylaws/sect6-7.html#6.2> and subclause 5.3.10.2 'Discussion of litigation, patents, and licensing' of the IEEE-SA Standards Board Operations Manual <https://standards.ieee.org/develop/policies/opman/sect5.html#5.3.10.2>.

The text contained in the 'Notice and Disclaimer of Liability Concerning the Use of IEEE Standards Documents' in respect to patents is mandated by subclause 6.3.1 'Public notice'

of the IEEE-SA Standards Board Operations Manual <https://standards.ieee.org/develop/policies/opman/sect6.html#6.3.1> and as such suggestions for change to this text should be directed to the IEEE-SA Standards Board Patent Committee Administrator at <patcom@ieee.org>.

Comment Type **TR**   *Comment Status* **X**   *Management*

The behaviour defined for the attributes aLldpXdot3LocPowerTypex and aLldpXdot3RemPowerTypex doesn't see to match the 'Power typex' TLV field that these attributes map to (see Table 79-9 and 79-10). Specifically, the behaviour doesn't include any reference to the single-signature and dual-signature values that Table 79-6d 'System setup field' defines for the 'Power typex' field. Rather than try to further expand the behaviour text to decode bits it would seem a better approach, since these are new attributes being added by IEEE P802.3bt, to change their syntax from 'BIT STRING [SIZE (4)]' to 'ENUMERATED value list'.

SuggestedRemedy

Suggest that:

[1] The 'APPROPRIATE SYNTAX:' text for the attributes aLldpXdot3LocPowerTypex and aLldpXdot3RemPowerTypex should be changed to read:

An ENUMERATED value list that has the following entries:
type4dualPD   Type 4 dual-signature PD
type4singlePD Type 4 single-signature PD
type3dualPD   Type 3 dual-signature PD
type3singlePD Type 3 single-signature PD
type2PD   Type 2 PD
type1PD   Type 1 PD
type4PSE   Type 4 PSE
type3PSE   Type 3 PSE
type2PSE   Type 2 PSE
type1PSE   Type 1 PSE

[2] The 'BEHAVIOUR DEFINED AS:' text for the attribute aLldpXdot3LocPowerTypex should be changed to read:

A read-only attribute that returns a value to indicate if the local system is a Type 1, Type 2, Type 3, or Type 4 PSE or PD, and in the case of a Type 3 or Type 4 PD, if it is single-signature or dual-signature.;

[3] The 'BEHAVIOUR DEFINED AS:' text for the attribute aLldpXdot3RemPowerTypex (subclause 30.12.3.1.18j, page 52, line 16) should be changed to read:

A read-only attribute that returns a value to indicate if the remote system is a Type 1, Type 2, Type 3, or Type 4 PSE or PD, and in the case of a Type 3 or Type 4 PD, if it is a single-signature or dual-signature.;

    This text reads 'Class 5 and above is communicated by the Power Class field ...'. I don't believe this is correct, I believe that the Class 5 and above is communicated by the 'Power Classx' field. In addition, suggest that TLV field names should always be placed in inverted commas.

SuggestedRemedy
    Suggest that the text 'Class 5 and above is communicated by the Power Class field ...' should be changed to read 'Class 5 and above is communicated by the "Power Classx" field ...'.

Note 1 to Table 79-3 states 'Port class information is implied by the support of the PSE or PD groups.'. As far as I can see there is no mention of a PD group in the last version of IETF RFC 3621 or in IEEE Std 802.3.1-2013 which deprecated IETF RFC 3621.

This table originated as Table G.1 in IEEE Std 802.1AB-2005, and was incorporated in to IEEE Std 802.3 by the IEEE Std 802.3bc-2009 Ethernet Organizationally Specific Type, Length, Values (TLVs) amendment, which added Clause 79. Based on this it seems that this note was generated as a result of comment 124 on IEEE P802.1AB draft D11 <http://www.ieee802.org/1/files/private/ab-drafts/d12/80211AB-D11-dis.pdf#Page=91>. The comment reads:

COMMENT TYPE: T
CLAUSE: Annex G..3.1
PAGE: 133
LINE: 9
COMMENT START:
The right columns look like missing information.
COMMENT END:
SUGGESTED CHANGES:
Either:
1) Fill the information in.
2) Insert an N/A notation
3) Insert an em dash, which should then be described in the glossary (802.17 did this).
SUGGESTED CHANGES END:

Disposition of Comment 124

Add notes -
For Port Class the information is implied by the support of the PSE or PD MIB groups For MDI power support the information is implied by support of the power over Ethernet MIB. Refer to the RFC

The latest version of IETF RFC 3621, version 08 dated 22nd June 2003 <https://tools.ietf.org/html/draft-ietf-hubmib-power-ethernet-mib-08> states 'The document proposes an extension to the Ethernet-like Interfaces MIB with a set of objects for managing a Power Source Equipment (PSE).'. Looking at the first version however, version 00 dated 25th June 2001, this text reads 'The document proposes an extension to the Ethernet-like Interfaces MIB [RFC2665] with a set of objects for managing a power Ethernet Powered Device (PD) and/or Power Source Equipment (PSE).'. This text changed between version 04 date 19th December 2002 <https://tools.ietf.org/html/draft-ietf-hubmib-power-ethernet-mib-04> and version 05 dated 21st May 2003

<https://tools.ietf.org/html/draft-ietf-hubmib-power-ethernet-mib-05>. Based on this it seems the IETF RFC 3621 drafts supported both PSE and PD management up to 21st May 2003.

While the IEEE P802.3AB comment was processed in October 2004, after PD management was removed from RFC 3621, it may be possible that this had not been noted, or it may have been assumed that RFC 3621 which is titled 'Power Ethernet MIB' supported both PDs and PSEs. Regardless, it seems that the intent of the note was to describe how to determine how to set this bit by reference to attributes in the IETF RFC.

Since (a) this note references a non-existent PD group in the MIB; (b) we don't mandate implementation of any particular management protocol, or any management, a PSE may or may not implement the PSE group in the MIB, and (c) in the reminder of subclause 79.3.2 'Power Via MDI TLV' we generally defined the bits through text rather than a cross reference to Objects, suggest that we do the same for the MDI power capabilities/status field.

SuggestedRemedy

Suggest that:

[1] The entire 'Object reference' column of Table 79-3 'MDI power capabilities/status field' is deleted.

[2] The two remaining notes for Table 79-3 'MDI power capabilities/status field' are deleted.

[3] New subclauses are added to describe the "MDI power capabilities/status" fields that read as follows:

79.3.2.1.1 Port class

The "Port class" field transmitted shall indicate if the port is a PSE or a PD.

79.3.2.1.2 PSE MDI power support

The "PSE MDI power support" field shall indicate if MDI power is supported.

79.3.2.1.3 PSE MDI power state

The "PSE MDI power state" field transmitted by a PSE shall indicate if the PSE function is enabled or disabled. When disabled all PSE functions are disabled and behaviour is as if there was no PSE functionality. The value of the "PSE MDI power state" transmitted by a PD is undefined.

79.3.2.1.4 PSE pairs control ability

The "PSE pairs control ability" field transmitted by a PSE shall indicate if the PSE has the capability to control which PSE Pinout Alternative (see 33.2.3 and 145.2.4) is used for PD detection and power. If capable the PSE Pinout Alternative used can be controlled through the pethPsePortPowerPairs attribute (see IEEE Std 802.3.1). If not the PSE Pinout Alternative used cannot be controlled through the pethPsePortPowerPairs attribute.

Comment Type **TR**   *Comment Status* **X**   *PSE Power*

Input Voltage drop to 0V is excessive.

Drop to 0V during 30us spec seems to be written for (theoretical) diode bridge at PD input. Have diode reverse recovery and cable inductance effects (peak reverse recovery current) been taken into account here?

Active bridges seem very popular in 802.3bt PD solutions to reduce dissipation in the input rectifier stage.
An immediate short at the input would significantly discharge Cport as it takes time to turn off the mosfet.

SuggestedRemedy

Increase minimum voltage level during first 30us and make spec compliant with active bridges at the PD input.

Proposed Response   *Response Status* **W**

Comment Type **TR**   *Comment Status* **X**   *PD Power*

The PD state diagram states that does not need to implement a current limit in the POWERED state.
(pd_current_limit <= FALSE)

This new ITR_LIM spec now seems to indicate the opposite.

SuggestedRemedy

Suppress the ITR_LIM requirement:
- Delete "the peak current shall not exceed ITR_LIM, as defined in Table 145-30, and"
- Delete Table 145-30

Proposed Response   *Response Status* **W**

TFTD

We should aslo discuss if we want to change the variable name "pd_current_limit" in the SD since it is very misleading. PDs are not required to "limit current", they are just subject to policing at certain times and thus should not draw unlimited current (which they can during Inrush.

the sentence at line 4 should be merged with the first sentence af the third paragraph (on
line 7) to make one paragraph. The third paragraph would then be the remainder of the text
at line 8. see proposed change where I've made the edit.
I also, gave a second option that combines to one paragraph and reorders the sentences.
no change to the wording has occured, this is purely editorial.
The reason for the change is the arrangement now implies the rest of the third paragraph
only applies to DS PDs.

SuggestedRemedy

new paragraphs:
Single-signature PDs shall advertise class signatures according to the PD Type and PD
requested Class, as defined in Table 145-24. Dual-signature PDs shall advertise class
signatures according to the PD Type and PD requested Class on each pairset, as defined
in Table 145-25.
The PD requested Class on a pairset is the maximum amount of power requested by the
PD on that pairset. Dual-signature PDs may advertise different class signatures on each
pairset. A dual-signature PD that is powered over only one pairset shall present a valid
class signature on the unpowered pairset.

Alternate option for rearranging:
The PD requested Class on a pairset is the maximum amount of power requested by the
PD on that pairset. Single-signature PDs shall advertise class signatures according to the
PD Type and PD requested Class, as defined in Table 145-24. Dual-signature PDs shall
advertise class signatures according to the PD Type and PD requested Class on each
pairset, as defined in Table 145-25. Dual-signature PDs may advertise different class
signatures on each pairset. A dual-signature PD that is powered over only one pairset shall
present a valid class signature on the unpowered pairset.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Rearrange as:

Jones, Chad   Cisco Systems, Inc.

Comment Type **TR**   *Comment Status* **X**

Chair notes... PSE State Diagram. I cannot find a path to power up with pse_ss_mode=0. There is the ELSE statement in POWER_ON, where alt_pwrd_pri gets set true and alt_pwrd_sec gets set false. This seems to allow a Type 3 PSE to power up a class 1-4 in 2P mode, (which my Chair note indicated I needed to confirm) but then it implies that there is no path to 4P power for Class 1-4. Will withdraw when I am educated on how to get to each operating point.

SuggestedRemedy

Change figure 145-13 to enable Class 1-4 operation on either 2P or 4P.

Proposed Response   *Response Status* **W**

TFTD

I believe it is done through the use of pse_ss_mode_update which transitions immediately back to POWER_ON.

Cl **33**   *SC* **33.5.1**   *P* **0**   *L* **0**   # i-349
Thompson, Geoffrey   Individual

Comment Type **ER**   *Comment Status* **X**   *Management*

Cl. 33.5.1, para 1 would seem to be a requirement that applies to cl. 145 devices but I find no clue in 145 to look to cl. 33 for additional requirements.

SuggestedRemedy

Add the requirement to cl. 145 (preferred) or put in some general statement that cl. 145 does not have the complete req'ts for a PSE (and PD?) and you have to read all of cl. 33 to find the rest of them and specify which ones.

Proposed Response   *Response Status* **W**

TFTD

It is my understanding that we are doing away with all of 33.5. Are we going to do this through maintenance? Or now that the clauses are split, will we just not require this for Type 3 and 4?

Cl **30**   *SC* **30.9.1.1**   *P* **35**   *L* **8**   # i-350
Thompson, Geoffrey   Individual

Comment Type **TR**   *Comment Status* **X**   *Management*

It would appear that all of the strikethrough in this clause is incorrect as it constitutes a change to cl. 33. It is easily possible that the affected text could be improved but it is not proper to remove.

SuggestedRemedy

Restore stricken text in 30.9.1.1. Consider improvements to the text.

Thompson, Geoffrey   Individual

Comment Type **ER** *Comment Status* **D** *Editorial*
The phrase "with a single interface to both the data it requires and the power to process this data" implies that the power provided is adequate to do data processing on 10GBASE-T. The TF has done no investigation to establish whether such is the case or is factual. Further, there are broader valid uses for PoE than is implied in the text.

SuggestedRemedy
Change text to read: "...with a single cabling interface for both the data and power."

Proposed Response *Response Status* **W**

Change: "This clause differentiates between the two ends of the powered portion of the link, defining the PSE and the PD as separate but related devices."

SuggestedRemedy

To read: "This clause differentiates between the two ends of the powered portion of the link, i.e the link section, defining the PSE and the PD as separate but related devices."

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Change to read: "This clause differentiates between the two ends of the powered portion of the link, i.e. the link section, defining the PSE and the PD as separate but related devices."

Cl **145**   *SC* **145.2**   *P* **97**   *L* **1**   # i-369
Thompson, Geoffrey   Individual

Comment Type **ER**   *Comment Status* **X**   *PI*

This paragraph is a problem. Regarding the first sentence, I don't believe we specify, or should specify a PSE at the MDI, we specify at the PI. After all, that is why we created the PI. Thus, I don't think there are any statements that express PSE specs in terms of the MDI (though I confess I did not search). If there are they should be re-expressed in terms of the PI. Regarding the second sentence, this is a HUGE escape clause which allows ANY mid-span to claim compliance to the standard

SuggestedRemedy

Replace with: "In the case of a Midspan PSE PI, the interface specification point is physically separate from the MDI and is contained within the cabling portion of the data transmission system."

Proposed Response   *Response Status* **W**

There is no reason for 145.1.3.1 Cabling requirements and 145.3.2 Link section requirements to be separate peer clauses. There is no difference between the two so there is no reason to have separate clauses.

SuggestedRemedy

Consolidate the text of the two sub-clauses into a single clause or consolidate the text into any new form of the specification.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Consolidate the text of the two sub-clauses into a single clause

---

Cl **145**   *SC* **145.1.3.1**   *P* **98**   *L* **28**   # i-379
Thompson, Geoffrey   Individual

Comment Type **ER**   *Comment Status* **D**   *Editorial*

The placement of the cabling specifications in 145.1.3 System Parameters is wrong. Cabling is not a "system parameter". Placement there is organizationally confusing. Cabling is a full element of the the specified 3 element system. The cabling should have its own sub-clause at a peer level with 145.2 PSE and 145.3 PD.

SuggestedRemedy

Move the specification (whether it be by reference or local) for cabling to its own higher level clause, presumably cl. 145.4 which would bump the rest of the clause further out.

Proposed Response   *Response Status* **W**

PROPOSED ACCEPT IN PRINCIPLE.

Move clause 145.1.3.1 (which now has what used to be 145.1.3.2 in it) to new clause 145.4 and increment all further clauses.

TFTD just to check

Cl **145**   *SC* **145.4.1**   *P* **199**   *L* **10**   # i-380
Thompson, Geoffrey   Individual

Comment Type **ER**   *Comment Status* **D**   *AES*

This clause confuses system requirements and element requirements. Only system requirements (and references to element requirements) should appear here. Conversely there should be element specifications in 145.2, 145.3 and link segment so that when each item is independently developed and sold it supports meeting the system requirement. Alternatively, the requirements could be stated as general requirements with no reference to element names (i.e. PSE, PD, link section) so that it can be referred to by the element clauses.

SuggestedRemedy

See comment.

Proposed Response   *Response Status* **W**

PROPOSED REJECT.

There is not a sufficient remedy provided in this comment.

Is this a PSE spec or a PD spec? Which PI is it measured at. Is this a controlling spec (it has a "shall") or a resultant spec that is a check of other specs? If this is not met where do you go to fix it?

SuggestedRemedy
Define what portion of the system this applies to and where to measure it. If it is an element spec then move it into the element that it is related to. If it is a system check spec then remove the shall and refer to the controlling element specs that will remedy any failure.

Thompson, Geoffrey   Individual

Comment Type **TR**   *Comment Status* **D**   *AES*
Reduce the midspan aspects of the spec to two simple statements, the effect a midspan can have on the acceptance test for a permanent link and effect a midspan can have on the acceptance test for a cord that meets standards allowances.

SuggestedRemedy
Prune the text so that the cabling acceptance tests (to be called out by reference) are the control.

Proposed Response   *Response Status* **W**
PROPOSED REJECT.

A sufficient remedy is not proposed in this comment.

Comment Type **TR**   *Comment Status* **X**   *Pres: Diminico*

For a constant power load and a worse case PSE the current per pair (ICable, A) is dependent on the loop resistance (equation 145-2). The current per pair/conductor is a parameter used to limit the number of 4-pair cables in a cable bundle. The 802.3bt nominal highest current per pair (ICable, A) derived by assuming the worse case DC loop restistance (RCh), associated with 100 meters of cabling, is being used to limit the number of 4-pair cables in a bundle for all cabling lengths (DCR). Assuming the worse case DCR (length) for all cabling topologies leads to overly pessimistic limits on the number of 4-pair cables in a cable bundle.

SuggestedRemedy

Develop informative Annex to characterize the current as a function of DCR (length) for constant power loads and worse case PSEs (equation 145-2). Presention of proposed Annex to be provided.

In the Exit from IDLE_ACS to WAIT_ACS we have the following conditions:
pd_autoclass * !tpon_timer_done *tinrush_timer_pri_done * pwr_app_pri *(!alt_pwrd_sec + (tinrush_timer_sec_done * pwr_app_sec))
It looks that we have two issues here:
1) redundancy in the term " tinrush_timer_pri_done * pwr_app_pri. If pwr_app_pri is true, it means that tinrush_timer_pri_done is TRUE as well.
2) the term (!alt_pwrd_sec + (tinrush_timer_sec_done * pwr_app_sec)) is always TRUE.
 - alt_pwrd_sec in false meaning that "The PSE is not to apply power to the Primary Alternative. "
- tinrush_timer_sec_done *pwr_app_pri indicates that we POWER up secondary pair and inrush is done in the secondary.
So, we have a condition that if we power up/or not power up.
It's like doing (X or not X) that is always true, which requires to remove this term completely...
In order to find what we really need here, let's expand the whole original term. It is equivalent to the following two parts:
a) pd_autoclass * !tpon_timer_done *tinrush_timer_pri_done * pwr_app_pri*!alt_pwrd_sec +
b) pd_autoclass * !tpon_timer_done *tinrush_timer_pri_done * pwr_app_pri *tinrush_timer_sec_done * pwr_app_sec
I believe that our intent is to allow Autoclass for Type 3 and 4 PSEs supporting single-signature PDs over 4-pairs or Type 3 PSE supporting SS-PD over 2-pairs.
There are few issues:
In part (a), redundancy in the term " tinrush_timer_pri_done * pwr_app_pri ".
If pwr_app_pri is true, it means that tinrush_timer_pri_done is TRUE as well.
As a result, it is sufficient to reduce this term from " tinrush_timer_pri_done * pwr_app_pri " to "pwr_app_pri", resulting with term (a):
"pd_autoclass * !tpon_timer_done * pwr_app_pri*!alt_pwrd_sec"
In part (b), the same concept as in part (a) applies to tinrush_timer_sec_done * pwr_app_sec i.e. If pwr_app_sec is true, it means that tinrush_timer_sec_done is TRUE as well.
As a result, we can reduce term (b) to:
"pd_autoclass * !tpon_timer_done * pwr_app_pri * pwr_app_sec"
 The net result is:
pd_autoclass * !tpon_timer_done * pwr_app_pri*!alt_pwrd_sec + pd_autoclass * !tpon_timer_done * pwr_app_pri * pwr_app_sec =
pd_autoclass * !tpon_timer_done * pwr_app_pri*(!alt_pwrd_sec + pwr_app_sec)

SuggestedRemedy

Change from:
"pd_autoclass * !tpon_timer_done *tinrush_timer_pri_done * pwr_app_pri *(!alt_pwrd_sec + (tinrush_timer_sec_done * pwr_app_sec))"
To:
 "pd_autoclass * !tpon_timer_done * pwr_app_pri*(!alt_pwrd_sec + pwr_app_sec)"

Figure 145-15 doesn't have the option of using short class event when doing "class probe" functionality as we have in single-signature class probe case. This cost with more time to complete process and more power dissipation. The same applies to the secondary part in page 137. It is suggested to replicate CLASSIFICATION pre-state and CLASS_PROBE from page Figure 145-13 page 128 in primary and secondary state machines with the relevant modifications.

SuggestedRemedy

State machine, CLASS_EVAL_PRI:
The intent of the following procedure:
IF (pd_cls_4PID_pri * (sig_sec = valid) * (sig_pri = valid) + pwr_app_sec)
THEN pd_4pair_cand<== TRUE
END "

Was to handle the following cases:
1) pd_4pair_cand is TRUE if both pairs have valid signature and pd-cls_4PID_pri is used.
OR
2) pd_4pair_cand is TRUE if both pairs have valid signature and secondary pair is powered and at the same time sig_pri is valid.

if we are doing the complete math we get:
pd_4pair_cand <== TRUE if:
pd_cls_4PID_pri * (sig_sec = valid) * (sig_pri = valid) +(sig_sec = valid) * (sig_pri = valid) * pwr_app_sec

Reviewing the state CLASS_EVAL_PRI shows that:
(a) If we are in CLASS_EVAL_PRI state, it means that pri_sig=valid.
(b) If pwr_app_sec is true, it means that sec_sig=valid but it doesn't mean that sig_pri=valid at the same time that pwr_app_sec is true.
Which means that:
(c) pwr_app_sec need to be multiplied by (sig_pri = valid)
(d) pd_cls_4PID_pri need to be multiplied only with sig_sec = valid

Resulting with:
IF (pd_cls_4PID_pri * (sig_sec = valid) + pwr_app_sec * (sig_pri = valid))
THEN pd_4pair_cand<== TRUE
END "

SuggestedRemedy

Change from: "(pd_cls_4PID_pri * (sig_sec = valid) * (sig_pri = valid) + pwr_app_sec)"
To: (pd_cls_4PID_pri * (sig_sec = valid) + pwr_app_sec* (sig_pri = valid))

In the exit from ENTRY_SEC to START_DETECT_SEC we have the following condition:
sism * ((!class_4PID_mult_events_sec * pwr_app_pri) + class_4PID_mult_events_sec) *
(CC_DET_SEQ=0 + CC_DET_SEQ=1).
class_4PID_mult_events_sec and !class_4PID_mult_events_sec doesn't belong here. The
way how we do detection sequence or connection check and detection sequence is not
relevant to the issue of how we do 4PID. The 4PID way is determined in page 139 line 6 in
CLASS_EVAL_PRI and page 139 line 6 CLASS_EVAL_SEC.

SuggestedRemedy

Two options:
1. change from: "sism * ((!class_4PID_mult_events_sec * pwr_app_pri) +
class_4PID_mult_events_sec) * (CC_DET_SEQ=0 + CC_DET_SEQ=1)."
To: "sism * (pwr_app_pri + ((CC_DET_SEQ=0) + (CC_DET_SEQ=1))."
2. Use other solution that doesn't block detecting the secondary in parallel to detecting the
primary for single signature or staggered detection for dual-signature after detection the
primary (regardless if primary is powered) per CC_DET_SEQ=0 or CC_DET_SEQ=1 which
is even more flexible than CC_DET_SEQ=0.

Darshan, Yair

Comment Type   **T**   *Comment Status* **D**   *PSE SD*

This comment rationale is identical to my comment regarding CLASS_EVAL_PRI, so this
comment will be shorter.
State machine, CLASS_EVAL_SEC:
IF (pd_cls_4PID_sec * (sig_sec = valid) * (sig_pri = valid) + pwr_app_pri)
THEN pd_4pair_cand <== TRUE
END "
Reviewing the logic shows that:
(c) If we are in CLASS_EVAL_SEC state, it means that sec_sig=valid.
(d) If pwr_app_pri is true, it means that pri_sig=valid but it doesn't mean that sig_sec=valid
at the same time that pwr_app_pri is true.
Resulting with changing: (pd_cls_4PID_sec * (sig_sec = valid) * (sig_pri = valid) +
pwr_app_pri)
 To: pd_cls_4PID_sec * (sig_pri = valid) + pwr_app_pri * (sig_sec = valid)

SuggestedRemedy

Change from: " (pd_cls_4PID_sec * (sig_sec = valid) * (sig_pri = valid) + pwr_app_pri) "
To:pd_cls_4PID_sec * (sig_pri = valid) + pwr_app_pri * (sig_sec = valid)

Proposed Response   *Response Status* **Z**

PROPOSED REJECT.

This comment was WITHDRAWN by the commenter.

In the exit from CLASS_EVAL_SEC to POWER_DENIDE_SEC we use in the condition:
"!ted_timer_sec_done + !ted_timer_done +
(pd_req_pwr_sec > pse_avail_pwr_sec) + (!pd_4pair_cand * !alt_pwrd_pri)".
The variable ted_timer_done looks that is not belong here since we are in the semi-
independent state machine or the intent for this is not clear.

SuggestedRemedy

Two options for remedy:
a)explain why we need ted_timer_done OR
b) Delete ted_timer_done

Proposed Response   *Response Status* **W**

PROPOSED REJECT.

Darshan, Yair

Comment Type **T**   *Comment Status* **X**   *PSE SD*

In the exit from ERROR_DELAY_SEC to IDLE we have the following condition:
"ted_timer_sec_done + option_detect_ted_sec".
A) The variable option_detect_ted_sec is missing from the variable list.
B) in addition I believe it is not required since if you have the option to do detection during
Ted time interval or you dont have the option, you are going to IDLE_SEC and in
IDLE_SEC you dont do detection.

SuggestedRemedy

Change from: " "ted_timer_sec_done + option_detect_ted_sec""
To: "ted_timer_sec_done "

Proposed Response   *Response Status* **W**

Darshan, Yair

Comment Type **T**   *Comment Status* **D**   *Repeats*

In the text "Single-signature PDs that request Class 4 or less shall be able to operate if
power is applied to either PD Mode A, PD Mode B, or both Modes simultaneously. All other
PDs may require being supplied over Mode A and Mode B simultaneously to operate at
their nominal power level."
The use of "simultaneously" in this text is that we are working over 4-pairs. Some readers
interpreted it as both pairs where powered on simultaneously i.e. at the same time i.e.
staggered powering is not allowed which obviously was not the intent. To clarify it, it is
suggested to remove " simultaneously" in the first occurrence and replace "
simultaneously" with "both Mode A and Mode B" in the 2nd occurrence.

SuggestedRemedy

Change text to:" Single-signature PDs that request Class 4 or less shall be able to operate
if power is applied to either PD Mode A, PD Mode B, or both Modes. All other PDs may
require being supplied over both Mode A and Mode B to operate at their nominal power
level."

Darshan, Yair

Comment Type **T**   *Comment Status* **X**   *PSE Power*

Resolve first comment marked CLASS8_PPD. Table 145-16 item 11, ILIM-2P. ILIM_2P is derived from Ipeak-2P_unb. The value of 0.99 was simulated when PClass_PD was 71W and as a result, Ppeak_PD was 1.05*71W. Now it is 71.3W and Ppeak_PD was already updated in all Tables and equation but not in related parameters in Table 145-16.
If Ppeak_PD for class 8 is 74.8W then ILIM-2P need to be 0.995A.
If Ppeak_PD for class 8 is 74.9W then ILIM-2P need to be 0.996A.

SuggestedRemedy

After resolving the comment marked CLASS8_PPD. Adopt the following options accordingly:
Option 1:
 If Ppeak_PD for class 8 is 74.8W then ILIM-2P need to be 0.995A.
Option 2:
If Ppeak_PD for class 8 is 74.9W then ILIM-2P need to be 0.996A.

Darshan, Yair

Comment Type **T**   *Comment Status* **X**   *Unbalance*

This comment is marked as LOWER02.
In the following text:
"ICon-2P-unb and Equation (145-15) are specified for total channel common mode pair
resistance RChan-2P from 0.2 ? to 12.5 ? and worst-case unbalance contribution by a PD.
PSEs that support channel common mode resistance less than 0.2 ?, or if RChan is less
than 0.1 ?, the PSE should meet ICon-2P-unb requirements when connected to
(Rload_min - 0.5 * RChan-2P) and (Rload_max - 0.5 * RChan-2P). This can be achieved
by using a lower RPSE_max or higher RPSE_min than required by Equation (145-15).
Lower RPSE _max values may be obtained by using smaller constant ? or higher
RPSE_min in Equation (145-15) in the form of RPSE_max = ? * RPSE_min + ?."

The following may be improved:
1. The "total" is not required.
2. To simplify and clarify the text that explains what to do when shorter cabling than 0.2
ohm is used
3. To simplify the use of " RPSE_max = ? * RPSE_min + ?"

SuggestedRemedy

Replaced the called out text with:
"The values for ICon-2P-unb and the relationship between RPSE_max and RPSE_min
(Equation (145-15)) are valid given that RChan-2P (see 145.1.3) ranges from 0.2 ? to 12.5
? and that the PD meets 145.3.8.10. In cases where RChan-2P is less than 0.2 ?, or
RChan is less than 0.1 ?, PSE compliance with ICon-2P-unb can be evaluated using
Rload_min and Rload_max both reduced by 0.5 * RChan-2P. This compliance will require
a reduction in the ratio of RPSE_max to RPSE_min presented by Equation (145-15). "

Proposed Response   *Response Status* **W**

TFTD

Equation 145-8 contains the parts that allow us to calculate the value of Icon-2P in case of
operating over 2-pairs and for the dual-signature case.
However, for the most important use case which is operating over 4-pairs.
Equation 145-8 contains the part "Icon-2P=min(Icon - IPort-2P-other, ICon-2P-unb) when
operating over 4-pairs.
-Icon is defined in Equation 145-9.
-Icon-2P_unb is defined in Table 145-16 item 5.
There is no information to find the value of Icon-2P_other in order to calculate the value of
Icon-2P. As a result, the spec is broken.

The changes we did when we move from "channel" to "Link section" breaks some of the work we did for pair to pair resistance unbalance. To fix it, we need to add a text that defines the equipment connector as part of the PSE PI and PD PI when tested for pair-to-pair resistance unbalance for compliance. In this way we don't break the link section definition due to the fact that the PSE load when PSE is tested for compliance and PD voltage source output resistance, Rsource, when PD is tested for compliance include the effect of the equivalent portion of the link section.

SuggestedRemedy

Adopt darshan_01_0917.pdf for detailed analysis and proposed baseline.

Darshan, Yair

Comment Type **T**   *Comment Status* **D**   *Pres: Darshan2*

This comment is not about active current balancing. This comment is about the typical use of PSE resistive elements to form Rpse_min and Rpse_max that meet equation 145-15 and when PSE connected to the PSE load specified in Table 145-17, will meet the values Icon-2P_unb in Table 145-16.
In D3.0, the maximum value of Rpse_min is not limited. Rpse_max is function of Rpse_min. If Rpse_min maximum value is not limited, it will cause the following issues:
(a) The internal PSE power supply open load voltage to significantly increase in order to keep the PSE voltage at the PI 50V min or 52V min pending the PSE Type under load. This will result with working outside the PSE operating voltage range.
(b) power loss at extreme values of Rpse_min which doesn't make sense.
(c) Per Equation 145-15, if Rpse_min is increased, Rpse_max is increased and at higher values of Rpse_min (starting at 0.5 ohms at Class 7-8 and 1 ohm at class 5-6), the contribution of Rpse to unbalance compared to the channel and PD, resulting with the increase of system unbalance at long cable which violates Icon-2P_unb when tested with test verification model in Table 145-17.
(d) there is no practical benefit to increase Rpse_min to any value.
(e) The above is not relevant to active current balancing.
See calculation results in darshan_02_0917.pdf.

SuggestedRemedy

(See calculation results in darshan_02_0917.pdf.)
Change from: "RPSE_min is the lower PSE common mode effective resistance in the powered pairs of the
same polarity."
To: "RPSE_min is the lower PSE common mode effective resistance in the powered pairs of the same polarity. The value of Rpse_min shall be limited to:
a) 1 ohms for class 5 and 6
b) 0.5 ohm for class 7 and 8.
The value of Rpse_min is not limited when active current balancing is used.

Proposed Response   *Response Status* **W**

PROPOSED REJECT.

TFTD

WFP

There is no reason to specify this. Reasons a, b, d, and e listed in the comment are not reasons to specify something, they are reasons for people not to make a product with high values of RPSE_min. Reason C (and A) points out that if they try to use a value that is too high, they will fail other specs.

Table 145-16, item 8, Tinrush: It is clear from the state machine that Tpon includes Tinrush. It means that effective Tpon is (400-50) msec=350ms or (400-75) ms=325mse which needs to cover long 1st class events, + 4 class events + design margin. group to discuss if it sufficient for their designs and applications in both single and dual-signatures.
To consider if Tpon need to be increased by ~50mse to compensate for the increase in the 1st long class events to keep our margins as in 802.3af/at. It doesn't affect reliability etc. since we had so far 200msec margin from the 600msec value from the 802.3af experiments and the actual spec numbers.

SuggestedRemedy

Increase Tpon from 400msec to 450msec or to what ever the group decide.

In the text "The equations in Table 145-28 are used to approximate the ratiometric peak powers of Class 1 through Class 8." . The equations are not in Table 145-28 and are missing for this clause.

SuggestedRemedy

1. Change from "The equations in Table 145-28 are used to approximate the ratiometric peak powers of Class 1 through Class 8."
To: "Equations 145-X and Equation 145-Y are used to approximate the ratiometric peak powers of Class 1 through Class 8."
2. Add the following text and equations at the end of this paragraph:
PPeak_PD = 1.05 * PDMaxPowerValue　　(145-X)
PPeak_PD-2P = 1.05 * PDMaxPowerValue_mode(X)　　(145-Y)
Where
PDMaxPowerValue　as defined in Table 145-22
PDMaxPowerValue_mode(X) as defined in Table 145-22

Proposed Response　　*Response Status* **W**

TFTD

How did we get here? Did we replace equations with numbers at some point and not update this?

1. Change from "The equations in Table 145-28 are used to approximate the ratiometric peak powers of Class 1 through Class 8."
To: "Equations 145-X and Equation 145-Y are used to approximate the ratiometric peak powers of Class 1 through Class 8."
2. Add the following text and equations at the end of this paragraph:
PPeak_PD = 1.05 * PDMaxPowerValue　　(145-X)
PPeak_PD-2P = 1.05 * PDMaxPowerValue_mode(X)　　(145-Y)
Where
PDMaxPowerValue is defined in Table 145-22
PDMaxPowerValue_mode(X) is defined in Table 145-22

The verification procedure of the measurements of Rpse_min and Rpse_max is missing from 145A.3

SuggestedRemedy

Add the following text after line 54 in page 262:
"Rpse_min and RPSE_max effective resistance verification procedure is described below:
1) With the PSE powered on and connected to a constant power sink in the PD section through the elements shown in Figure 145A-2, which is set to PClass_PD measured at the PD PI, measure the currents i1, i2, i3 and i4 and the voltages Veff1, Veff2, Veff3 and Veff4.
2) Calculate the RPSE_min and RPSE_max values of each pair of the same polarity by calculating the following:
For the positive pairs:
R1=RPSE_min=Veff1/i1
R2=RPSE_max=Veff2/i2
For the negative pairs:
R3=RPSE_min=Veff3/i3
R4=RPSE_max=Veff4/i4
3) Verify that on each pair of the same polarity, RPSE_min and RPSE_max meets Equation 145-15.
4) Repeat steps 1 to 3 with the RCh_unb_min, RPD_min swapped location with RCh_unb_max, RPD_max. "

Darshan, Yair

Comment Type **T** *Comment Status* **X** *Pres: Darshan8*

CC_DET_SEQ=3 means: Connection check is followed by staggered detection. Figure 145B-11 for dual-signature PD shows that CC_DEC_SEQ=3 is only possible when the Detection of the 2nd pairset starts after Tpon +Tx of 1st pairset which is possible but not the only possibility per CC_DET_SEQ=3 definition.
We need clearly to show that first we see CC, and then staggered detection, and then the classification and power_on can be staggered or not. We need to add Figure 145B-11A to show this possibility that shows all possibilities.

Darshan, Yair

Comment Type **T**   *Comment Status* **X**   *LLDP*

Table 79-6f describes autoclass field. Per the draft, autoclass can be requested any time including after the physical layer autoclass after transitioning to POWER_ON.
The are some issues that appear to be not closed.
In the case PD is and PSE supporting LLDP: Why PD will ask for autoclass through LLDP if he can do similar task by LLDP? I am asking this question since if PD eventually do this, it add a level of complexity (that can be resolved) that yet is not addressed in the standard. for example:
a) There is no syncing or handshake mechanism defined to verify that the PD won't start to consume more power than the PSE allows it to draw, before the PSE is ready for it
b) It is also not covered in the state machine diagram at page 131 line 43, when moving from IDLE_ACS to MEASURE_ACS.
To resolve this, we need at least to add new variable "dll_autoclass_pd_pse_ready". This variable will indicate that PD has set it's requested power level for the PSE to be measure and the PSE has the available power to measure the PD requested power without going to overload/Ilim 2p condition.

SuggestedRemedy

1. add new variable "dll_autoclass_pd_pse_ready" to the variable list in 145.2.5.4 with the following definition:
"dll_autoclass_pd_pse_ready
 This variable indicates that PD has set it's requested power level for the PSE to be measure and the PSE has the available power in order to stay powered and to measure the PD requested power without going to overload/Ilim 2p condition."
2. In the state machine in page 131 line 43 in the exit from IDLE_ACS to MEASURE_ACS, change from:

The following question has been asked regarding diode aging and its affect on PD_Vdiff
that affect unbalance.
Background:
Our spec defines unbalance requirements for the PSE in terms of VPort_PSE-2P, Icon-
2P_unb and for the PD in terms of Icon-2P_unb and inexplicit design requirement to keep
PD_Vdiff=60mV max measured at 1-10mA range. The PD_Vdiff has the highest effect on
the system current/resistance unbalance.
The following use case has been investigated:
A PD is connected to a PSE over 4-pairs. The PSE is using Alt A (MDI) and Alt B (X)
resulting with 1,2 and 7,8 are positive and 3,6 and 4,5 are negative. It runs this way for
MANY years. The PD front end is not an active bridge, it is a diode bridge. The PSE has
been replaced and it uses Alt A (MDI) and Alt B (S). Now, 1,2 and 4,5 are positive and 3,6
and 7,8 are negative. Now we have diodes that have been aged (1,2 and 3,6) in parallel
with diodes that have never have current through them (the ones in 4,5 and 7,8). This is
not simply switching from the old diodes to the new ones, its mixing old with new. The
questions are:
1. If the aging has an effect on Vf, then we may have higher mismatch between the diodes
in parallel leading to higher unbalance.
2. In an extreme case, we may have a runaway situation as the aged diode drops more
power and heats more than the 'new' diode.
Answers:
1. All diodes in the diode bridge has to have 60mV maximum Vdiff between any
permutations of each two diodes.
2. Silicon doesn't have a memory. The performance characteristics change may changed
after diode end of life time period due to mechanical construction and other issues that are
function of current conduction.
3. Diodes that are at their end of life will introduce higher leakage current, higher VF, and
other parameters will exceed the spec.
4. As long as the diode is kept with their allowed operating conditions, VF will not change
significantly during the diode defined life time with or without current conduction.
5. Life time of a diode of reliable vendor can be 20 years. The lowest life time value of
reliable vendors is 10 years. The typical is somewhere between these ranges.
6. As a result of the above, any component in the PD or PSE need to be selected with life
time which exceed the product life time like any other designs.
7. If vendor follow the above rules, the effect of aging should not be a problem for VF (or
other parameter).

SuggestedRemedy

This comment is marked CC_DET_SEQ=3.
This problem was a dressed in other comment and is repeated here in shorter and clearer way.
Using CC_DET_SEQ=3 is possible if we exit from ENTRY_SEC and from IDLE_SEC to START_DETECT_SEC.
In the exit from   IDLE_SEC to START_DETECT_SEC we have the following conditions:
(!pwr_app_sec *pwr_app_pri) + ((CC_DET_SEQ=3) * option_probe_alt_sec * !det_start_pri * !det_once_sec) = A+B.
This condition syas:
A) the first part of the condition says: go and detect sec if power is not applied to secondary AND power is applied to primary. This allows detection of secondary only if primary is ON. This is OK but not cover the other case of CC_DET_SEQ=3 that detect secondary after detection primary and not waiting until primary is ON.
In addition, it doesnt allow to do multiple detection+classification until power on.
B) The 2nd part is OK but doesnt resolve the issue in part A.
Currently the staggered detection i slimited to the case of doing detection on sec only if pri is ON and it should be limited per th eCC_DET_SEQ definition to only this case which will prevent the general case of doing sequences of staggered detection + classification sequences until power on of both alternatives.
The solution is to add part (C) which is (CC_DET_SEQ=3)*do_detect_pri_done

SuggestedRemedy

Change from:
"(!pwr_app_sec *pwr_app_pri) + ((CC_DET_SEQ=3) * option_probe_alt_sec * !det_start_pri * !det_once_sec)"
To:
"(!pwr_app_sec *pwr_app_pri) + ((CC_DET_SEQ=3) * option_probe_alt_sec * !det_start_pri * !det_once_sec) + ((CC_DET_SEQ=3)*do_detect_pri_done)"

Comment Type **T**   *Comment Status* **D**   *PSE SD*

In the POWER_ON state we are addressing two use cases:
a) The PSE is working over 4-pairs
b) The PSE is working over 2-pairs for class <5
If we work over 4-pairs and we had error on the pri for example, we are allowing the sec keep working until the sec will have error (in this case we go to IDLE) or the sec will continue to work.
In the case that the sec is continued to work, we need to move to SEMI_PWR_SEC state in page 131 which is done by the exit from POWER_ON to SEMI_PWR_SEC which is: semi_pwr_en * !error_sec * error_pri.
Now we are in SEMI_PWR_SEC and our options to exit from SEMI_PWR_SEC is when we have erro_sec (going to IDLE) or not sufficient power (going to POWER_DENIDE and then to IDLE) or tmpdo_timer_done (going to IDLE)
So far all is good.
Now if the use case is that the port is working with single-signature PD over 2-pairs, class <5. This will cause issue in the state machine. Why?
1. The above use case means per the POWER_ON state alt_pwrd_pri=TRUE and alt_pwrd_pri=FALSE i.e. only the pri is ON.
2. Now something happened and I have error event on the pri.
3. When I have error event on the primary, the condition from POWER_ON to SEMI_POWER_ON_SEC became true: semi_pwr_en * !error_sec * error_pri and we move to SEMI_POWER_ON_SEC which is a problem...THE SEC was OFF already...so I can't be in SEMI_POWER_ON_SEC. So the question is, what we have to do to exit from SEMI_POWER_ON_SEC back to IDLE or block us from going to SEMI_POWER_ON_SEC?
The simplest way is: to prevent going to SEMI_POWER_ON_SEC in this case and allow going to IDLE through the ERROR_DELAY state.

SuggestedRemedy

1. Make the following changes in the exit from POWER_ON to SEMI_PWRON_SEC:
Change from: "semi_pwr_en * !error_sec * error_pri"
To: "semi_pwr_en * !error_sec * error_pri*altpwrd_sec"
2. Make the following changes in the exit from POWER_ON to ERROR_DELAY:
Change from:"(!semi_pwr_en*(error_pri+ error_sec))+(semi_pwr_en*error_pri* error_sec)"
To:"(!semi_pwr_en*(error_pri+error_sec))+(semi_pwr_en*error_pri*error_sec)+ (semi_pwr_en*error_pri*!alt_pwrd_sec)"

Darshan, Yair

Comment Type **T**   *Comment Status* **D**   *PSE SD*

This comment is marked as CC_DET_SEQ=3-1 and is improvement of the comment marked as CC_DET_SEQ=3.
In the exit from IDLE_SEC to START_DETECT_SEC we have the following condition:
(!pwr_app_sec * pwr_app_pri) + ((CC_DET_SEQ=3) * option_probe_alt_sec * !det_start_pri * !det_once_sec)
Based on the description in page 109 lines 37-38 for CC_DET_SEQ and specifically, CC_DET_SEQ=3 for dual-signature means: Connection check is followed by staggered detection
(The analysis and simulations results for other sequences 0, 1 and 2 are covered by other comments and most of them are OK).

The staggered detection range may occur with starting the secondary detection after doing the primary detection (option 1) up to doing the secondary detection only if the primary is on (option 2). This covers the full range of possibilities.
Option 1 is normally used when class_4PID_mult_events_sec=TRUE. This currently is not covered by the state machine.
Option 2 is normally used when class_4PID_mult_events_sec=FALSE and it is covered in the 1st part of the condition: (!pwr_app_sec * pwr_app_pri).
Option 3 is covers the case that the primary return to IDLE_PRI due to various reasons and the secondary didn't detect even once: ((CC_DET_SEQ=3) * option_probe_alt_sec * !det_start_pri * !det_once_sec).

The current state diagram covers option 2 and 3, and does not cover option 1!

The state diagram should allow staggered detection before Primary power up, after primary power up, and during power up in case that class_4PID_mult_events_sec is set to FALSE. The proposed changes in the state diagram will allow staggered detection after Primary finished its 1st detection without affecting the previous functionality and flow, by oring the additional missing possibility (option 1).
The proposed changes do not affect:
a) The behavior of other CC_DET_SEQ ?3 flows.
b) Previous state diagram possibilities.

In addition, the proposed changes also required to cover multiple cycles of detection+classification until host decides to power on the port (which is covered by darshan_04_0917.pdf).
The additional missing possibility is covered by adding the following part:
+ (class_4PID_mult_events_sec*(CC_DET_SEQ=3) * !det_once_sec * det_once_pri)
In order to implement the addition, we need to add the following variable for the primary side (similar variable is already exist for the secondary):

"det_once_pri
This variable indicates if the PSE has probed the Primary Alternative at least once, when entering to DETECT_EVAL_PRI.
Values:

TYPE: TR/technical required ER/editorial required GR/general required T/technical E/editorial G/general
COMMENT STATUS: D/dispatched A/accepted R/rejected   RESPONSE STATUS: O/open W/written C/closed U/unsatisfied Z/withdrawn
SORT ORDER: Comment ID

FALSE: The PSE has not probed on the Primary Alternative since entering the Primary Alternative state diagram.
TRUE: The PSE has probed the Primary Alternative at least once since entering the Primary Alternative state diagram."

In the above proposed change, det_once_pri is used as a condition for starting detection in the secondary any time until power up, after primary was detected at least once.
det_once_pri is set to FALSE when sism = FALSE at ENTRY_PRI.
det_once_pri is set to TRUE when Primary state diagram reaches to "DETECT_EVAL_PRI", to clearly indicate that detection on primary has ended before tdet_timer_pri expired.

SuggestedRemedy

1. Change from:
"(!pwr_app_sec *pwr_app_pri) + ((CC_DET_SEQ=3) * option_probe_alt_sec * !det_start_pri * !det_once_sec)"
To:
"(!pwr_app_sec *pwr_app_pri) + ((CC_DET_SEQ=3) * option_probe_alt_sec * !det_start_pri * !det_once_sec) +
(class_4PID_mult_events_sec*(CC_DET_SEQ=3) * !det_once_sec * det_once_pri)
2. Add the following variable to the variable list:
det_once_pri
This variable indicates if the PSE has probed the Primary Alternative at least once, when entering to DETECT_EVAL_PRI. Values:
FALSE: The PSE has not probed on the Primary Alternative since entering the Primary Alternative state diagram.
TRUE: The PSE has probed the Primary Alternative at least once since entering the Primary Alternative state diagram.

In the variable option_probe_alt_sec definition:
"option_probe_alt_sec
This variable indicates if the PSE will continue to detect and conditionally class on the
Secondary Alternative in the event an invalid detect or class result is found on the Primary
Alternative. This variable applies to CC_DET_SEQ = 3.
Values:
FALSE: PSE does not probe the Secondary Alternative if an invalid signature is found on
the Primary Alternative.
TRUE: PSE does probe the Secondary Alternative if an invalid signature is found on the
Primary Alternative." we few issues:
1) The definition text says "in the event an invalid detect or class result is found" is not
reflected in the text that defines the TRUE and FALSE. Only the "invalid detection" is
addressed.
2) The text " if an invalid signature is found" in the TRUE and FALSE definition is not
logically accurate and can lead to wrong interpretation. It should be " if an invalid signature
will be found" since this variable can be set in system config phase or on the fly, but the
current definition may be interpreted as this parameter can be configured only on the fly as
function of the result of primary detection signature result if valid or not.

SuggestedRemedy

Change the TRUE and FALSE definition from:
"FALSE: PSE does not probe the Secondary Alternative if an invalid signature is found on
the Primary Alternative.
TRUE: PSE does probe the Secondary Alternative if an invalid signature is found on the
Primary Alternative."
To:
"FALSE: PSE does not probe the Secondary Alternative if an invalid detection signature or
classification will be found on the Primary Alternative.
TRUE: PSE does probe the Secondary Alternative if an invalid detection signature or
classification will be found on the Primary Alternative"

There is redundant parenthesis in the exit from ENTRY_SEC to START_DETECT_SEC:
"sism *((!class_4PID_mult_events_sec * pwr_app_pri) + class_4PID_mult_events_sec) *
(CC_DET_SEQ=0 + CC_DET_SEQ=1)"
in the part: (!class_4PID_mult_events_sec * pwr_app_pri).

SuggestedRemedy

Change from:
"sism *((!class_4PID_mult_events_sec * pwr_app_pri) + class_4PID_mult_events_sec) *
(CC_DET_SEQ=0 + CC_DET_SEQ=1)"
To:
"sism *(!class_4PID_mult_events_sec * pwr_app_pri + class_4PID_mult_events_sec) *
(CC_DET_SEQ=0 + CC_DET_SEQ=1)"

In Figure 145-16, in the exit from ENTRY_SEC to START_DET_SEC, when selecting CC_DET_SEQ 0 or 1, and class_4PID_multi_event_sec = FALSE, the secondary state machine allows to move from ENTRY_SEC state to START_DETECT_SEC only if pwr_app_pri = TRUE per the existing condition:
sism * ((!class_4PID_mult_events_sec * pwr_app_pri) + class_4PID_mult_events_sec) * (CC_DET_SEQ=0 + CC_DET_SEQ=1)

If Primary fails to powerup, the Primary state machine returns back to IDLE_PRI. As a result, pwr_app_pri variable will remain in FALSE, and the secondary state machine won't be able to exit from ENTRY_SEC i.e. will be stuck there.
The easy way to handle this problem is to enable moving to START_DETECT_SEC from ENTRY_SEC, also if primary performed detection at least once and is now in IDLE_PRI state which prevents stuck at ENTRY_SEC. This solution requires the addition of new variable det_once_pri (the current draft has only det_once_sec) which is required also by other comments that all related to each other and can be see in darshan_04_0917.pdf.

SuggestedRemedy

See darshan_04_0917.pdf for how the following change is also addresses other issues including the possibility to do cycles of detection + class_probe events on primary and secondary with the option to go to IDLE_PRI/SEC and WAIT_PRI/SEC.
----
1) Add the following variable:
det_once_pri
This variable indicates if the PSE has probed the Primary Alternative at least once, when entering to DETECT_EVAL_PRI. Values:
FALSE: The PSE has not probed on the Primary Alternative since entering the Primary Alternative state diagram.
TRUE: The PSE has probed the Primary Alternative at least once since entering the Primary Alternative state diagram.
2) Change from:
"sism *((!class_4PID_mult_events_sec * pwr_app_pri) + class_4PID_mult_events_sec) * (CC_DET_SEQ=0 + CC_DET_SEQ=1)"
To:
sism * ((!class_4PID_mult_events_sec * (pwr_app_pri + det_once_pri * !det_start_pri)) + class_4PID_mult_events_sec) * (CC_DET_SEQ=0 + CC_DET_SEQ=1).

Darshan, Yair

Comment Type **T**   *Comment Status* **D**   *Repeats*

In the transition between ENTRY_SEC to START_DET_SEC we have the following condition:
sism * ((!class_4PID_mult_events_sec * pwr_app_pri) + class_4PID_mult_events_sec) * (CC_DET_SEQ=0 + CC_DET_SEQ=1).
In this condition, when class_4PID_mult_events_sec=FALSE, and CC_DET_SEQ=0 OR 1, If START_DET_PRI exit to IDLE_PRI due to tdet_timer_pri_done, the pwr_app_pri will remain in FALSE which wont allow exiting from ENTRY_SEC to START_DETECT_SEC and the secondary state machine remain stuck in ENTRY_SEC.

The proposed solution for this problem is:
1) To add stop_tdet_timer_pri in the DETECT_EVAL_PRI state. This action ensures that tdet_timer_pri_done will remain FALSE when moving from START_DETECT_PRI to DETECT_EVAL_PRI. This action enables the usage of tdet_timer_pri_done in the secondary state machine at the exit from ENTRY_SEC to START_DETECT_SEC.
2. Add "tdet_timer_pri_done to the condition of the exit from ENTRY_SEC to START_DETECT_SEC as follows:
"sism *((!class_4PID_mult_events_sec * (pwr_app_pri + tdet_timer_pri_done)) + class_4PID_mult_events_sec) * (CC_DET_SEQ=0 + CC_DET_SEQ=1)" . This change will allow to move to START_DETECT_SEC in case that we move from START_DETECT_PRI to IDLE_PRI due to tdet_timer_pri expiration.

SuggestedRemedy

1. Add "stop_tdet_timer_pri" to the DETECT_EVAL_PRI state.
2. Add "tdet_timer_pri_done to the condition of the exit from ENTRY_SEC to START_DETECT_SEC by performing the following change:
Change from:
"sism *((!class_4PID_mult_events_sec * pwr_app_pri) + class_4PID_mult_events_sec) * (CC_DET_SEQ=0 + CC_DET_SEQ=1)"
To:
"sism *((!class_4PID_mult_events_sec * (pwr_app_pri + tdet_timer_pri_done)) + class_4PID_mult_events_sec) * (CC_DET_SEQ=0 + CC_DET_SEQ=1)"

Due to the fact that item 2 need additional changes due to other comments, and in order to meet the requirement that we need single independent comment for each issue which I did here but may cause editor confusion of how to apply the remedies of other comments, See darshan_04_0917.pdf for how the above change is combined with other changes i.e. the possibility to do cycles of detection + class_probe events on primary and secondary with the option to go to IDLE_PRI/SEC and WAIT_PRI/SEC.

This comment is an update to the comment that requires to delete Figure 145B-3:
Per the definition of CC_DET_SEQ=0 for dual-signature, the detection need to be parallel and not staggered and this contradicts figure 145B-3 that is shown as one of the staggered detection versions. So we have two options to resolve this:
a) To delete figure 145B-3 to sync with CC_DET_SEQ=0 definition for dual-signature PDs and also update state machine which will be complicated task at this point of time. OR,
b) (Preferred) Keep Figure 145B-3, and change the "CC_DET_SEQ=0 definition that to allow staggered detection in addition to parallel detection which currently is supported by the state machine.

SuggestedRemedy

Change "Connection Check is followed by staggered detection for a single-signature PD and parallel detection for a dual-signature PD."
To: Connection Check is followed by staggered detection for a single-signature PD and parallel or staggered detection for a dual-signature PD."

Bennett, Ken

Comment Type **T**   *Comment Status* **X**   *PD Power*

"The sentence starting with ""A single-signature PD includes CPort..."" leads into a listing of PD Types and Cport values that ""Intrinsically meet the requirements in this subclause"". These are informative statements, and are not entirely correct:

1) A type 4 PD with 360uF can be assigned a class corresponding to Type 3 limits. The Type 3 limit is 180uF, so the Type 4 limit of 360uF is not true in this case.

2) It's conceivable for any of the cases that a transient could cause a power surge and/or fault in a PD for reasons other than just Cport."

SuggestedRemedy

Delete the text starting at line 4 ("A single signature PD includes...") and ending at line 17, just after the list of PD types and capacitances.

Proposed Response   *Response Status* **W**

TFTD

Should we just transition this list to class based?

Johnson, Peter

Comment Type **T**   *Comment Status* **X**   *PSE Inrush*

Dual Signature Class 5 Minimum I_Inrush-2P is specified as 325 mA. Class 5 Dual Signature PD's are specified in 145.3.8.3 as allowing up to 180uF for C_Port-2P without PD current limiting. Is there a rationale why 325mA current limiting meets the needs of a Class 5 Dual Signature but we require 400mA for all other cases where C_Port or C_Port-2P can go up to 180uF ?

SuggestedRemedy

Unless there is a justifiable reason, I_Inrush should be 800mA and I_Inrush-2P 400mA for the Type-4 Dual Signature case.

Proposed Response   *Response Status* **W**

TFTD

That is a very good question Pete.

Cl **145**   *SC* **145.2.8.6**   *P* **162**   *L* **33**   # i-486

Johnson, Peter

Comment Type **T**   *Comment Status* **X**   *PSE Inrush*

(Re-filed comment from D 2.4) There is an inconsistency in the three minimum inrush current requirements a), b), and c) and Table 145-16. Conditions a) and b) specify "minimum Iinrush-2P" requirements with actual values while Table 145-16 is blank for minimum Inrush-2P given Single Signature PD. Are these figures really applicable to Iinrush-2P or are they applicable to Iinrush? Item c) says refer to Table 145-16 for minimum Iinrush-2P, but again, those boxes are blank for Single Signature.

SuggestedRemedy

Following modification has implementation implications but could resolve the confusion:
a) ...voltages between 0 V and 10 V, the minimum I_Inrush when powering a Single Signature PD and the minimum I_Inrush-2P when powering a Dual Signature PD shall be 5 mA.
b) ... voltages between 10 V and 30 V, the minimum I_Inrush when powering a Single Signature PD and the minimum I_Inrush-2P when powering a Dual Signature PD shall be 60 mA.
c) ... voltages above 30 V, the minimum I_Inrush when powering a Single Signature PD and the minimum I_Inrush and I_Inrush-2P when powering a Dual Signature PD are specified in Table 145-16.

Johnson, Peter

Comment Type **T**   *Comment Status* **X**   *PD Power*

The text "Single-signature PDs shall not exceed ICon-2P-unb for longer than TCUT-2P min and 5 % duty cycle, and shall not exceed IPeak-2P-unb, as defined in Equation (145-12) on any pair..." fails to account for the fact that there are many combinations of PSE voltage and PD class where IPeak-2P_unb is a value LESS than ICon-2P-unb. It makes no sense that peak power must be less than continuous power.

SuggestedRemedy

This creates a fundmental dilemma because IPeak-2P_unb is a function of V_PSE and therefore only the PSE knows what IPeak-2P_unb current is, not the PD. To be universal, PD current balance, both instantaneous and average, must therefore be restricted to Icon-2P-unb. Language would be: "Single-signature PDs shall not exceed ICon-2P-unb on any pair..."

Proposed Response   *Response Status* **W**

Johnson, Peter

Comment Type **T**   *Comment Status* **X**   *PD Inrush*

Present text is "A PD may limit the inrush current below I_Inrush_PD and I_Inrush_PD-2P to allow for large values..."

This instance is part of a broader problem where certain parameters in certain tables have a MAX is specified but no MIN, and are treated as if they are constants rather than ranges with no minimum value. If the parameter is truly a constant, then it seems it should appear in both MIN and MAX columns of the table.

SuggestedRemedy

The quick fix in this instance is to use I_Inrush_PD(max) and I_Inrush_PD-2P(max).

Johnson, Peter

Comment Type   **T**   *Comment Status* **X**   *PD Inrush*

Present text is "PDs shall draw less than I_Inrush_PD and I_Inrush_PD-2P from
T_Inrush_PD(max) until T_delay-2P(min), when...".

At face value, this says neither the PD nor the PSE should be current limiting after
T_Inrush_PD(max). But it also suggests that a PD that implements current limiting at a
low threshold (e.g. 100mA) must then drop below that threshold after Tinrush_PD(max).
Is that what was meant by this paragraph?

SuggestedRemedy

I cannot propose a solution here without a better understanding of what was meant by the
paragraph.   I would want to be sure that the paragraph is either correctly using
I_Inrush_PD and I_Inrush_PD-2P or that the intent requires using I_Inrush_PD(max) and
I_Inrush_PD-2P(max)

Proposed Response   *Response Status*   **W**

TFTD

The intent is to say that after Tinrush_PD(max) the PD must have its current controlled so
that it draws less than Iinrush(-2p). After T_delay-2P it can then draw the power assigned
to it during classification.
