Editorial: #109, #110, #126

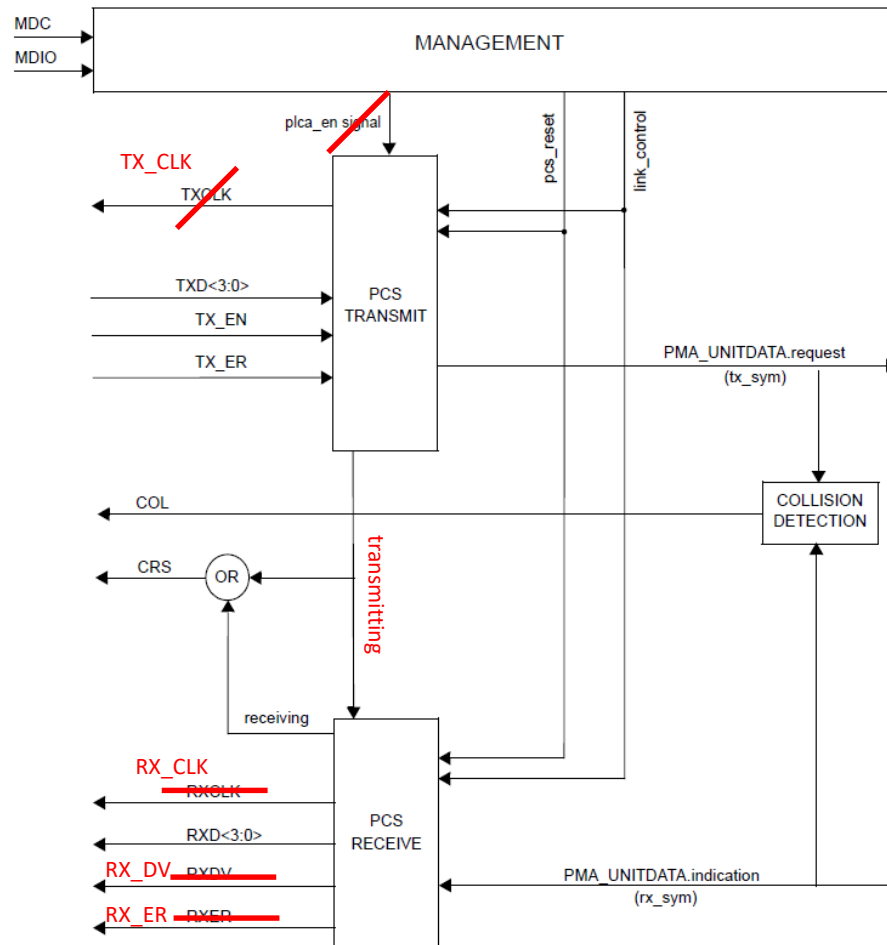

Figure 147-2—PCS reference diagram

Collision detection shall be disabled when operating in full-duplex mode

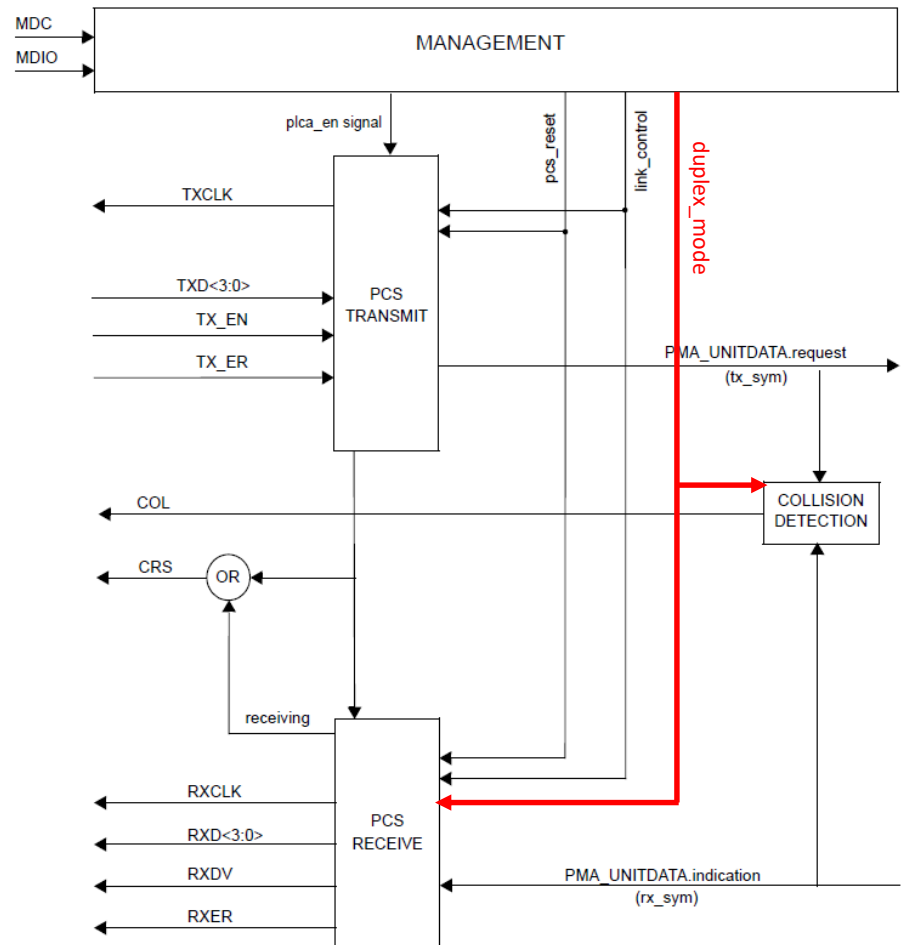

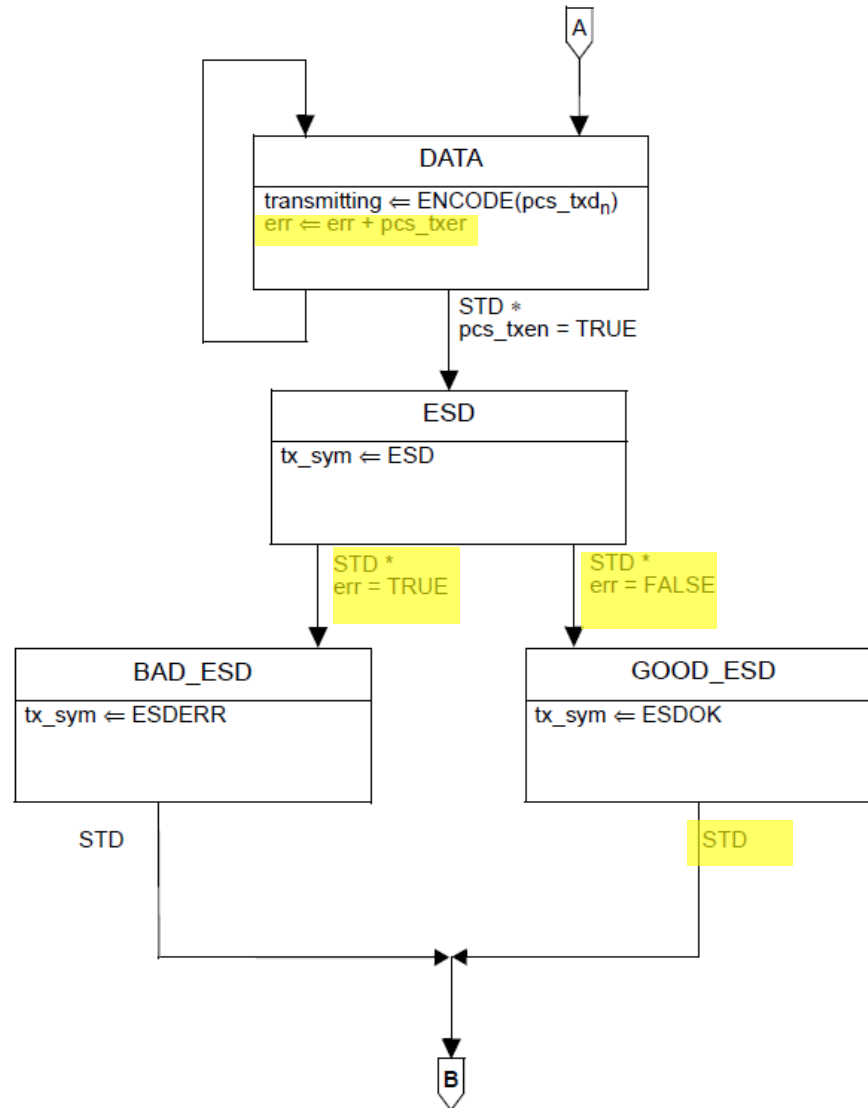

Figure 147-2—PCS reference diagram

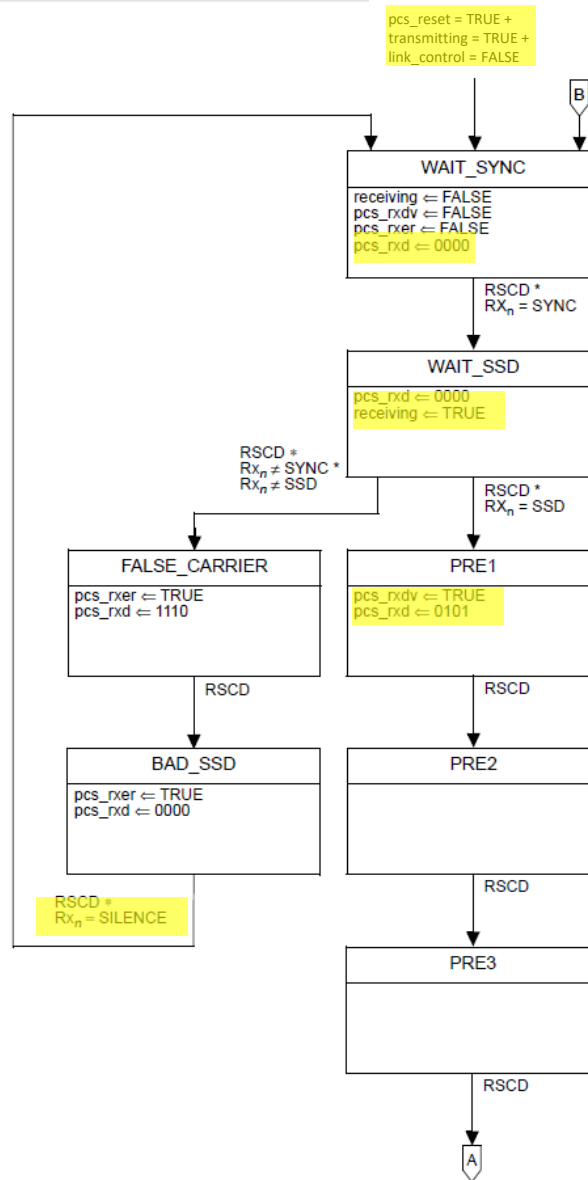

- In order to support full-duplex mode, the PCS RX block should be configured accordingly

147.2.3.1 Variables

...

`duplex_mode`

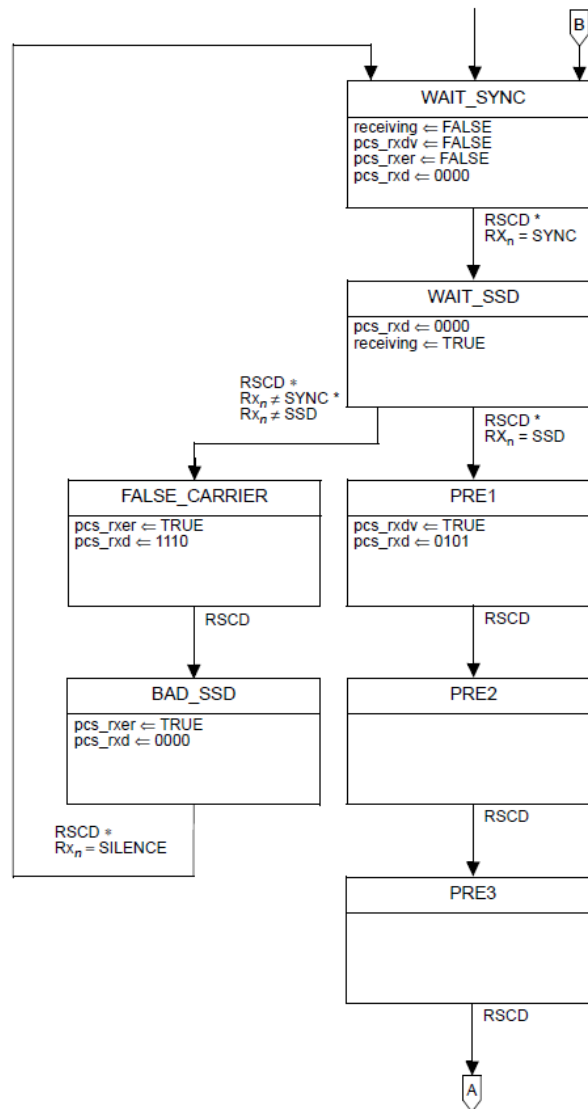

indicates whether the PHY is configured for full-duplex operation (`DUPLEX_FULL`) or half-duplex operation (`DUPLEX_HALF`). This variable is set after bit 8 in MDIO register 0 defined in table 22-7

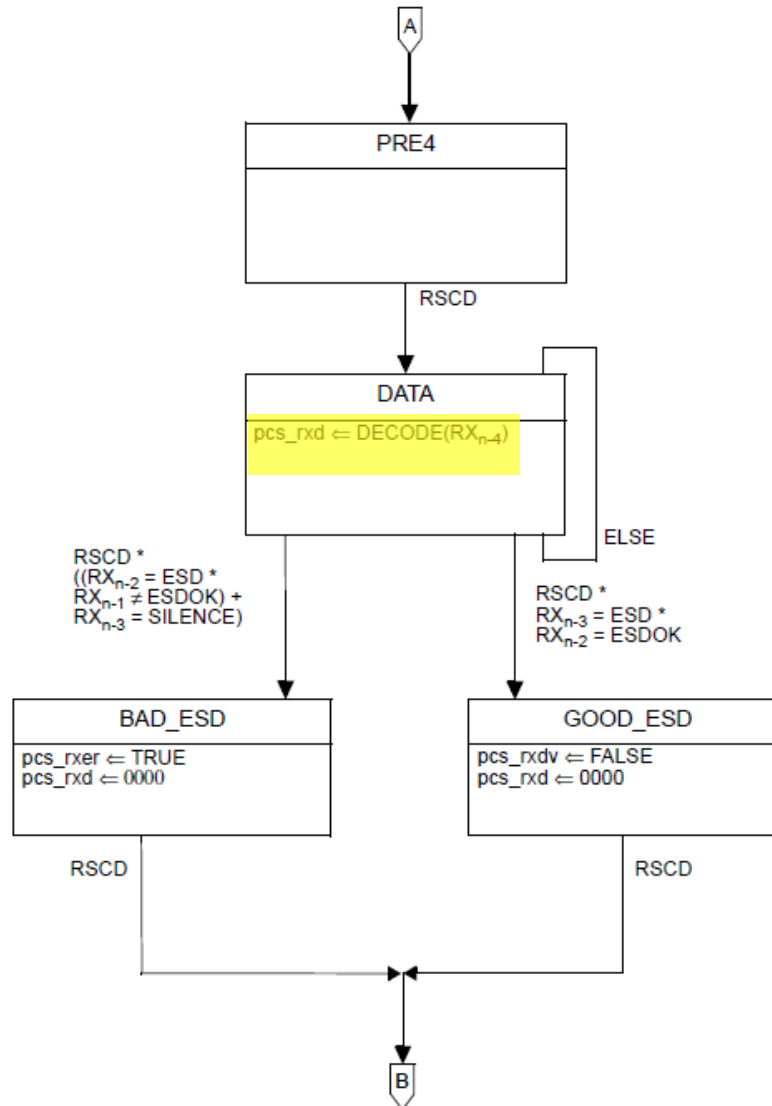

Technical: #131

(transmitting = TRUE * duplex_mode = DUPLEX_HALF)

pcs_reset = TRUE +
~~transmitting = TRUE +~~
link_control = FALSE

In order to support full-duplex mode, the PCS RX block should behave accordingly

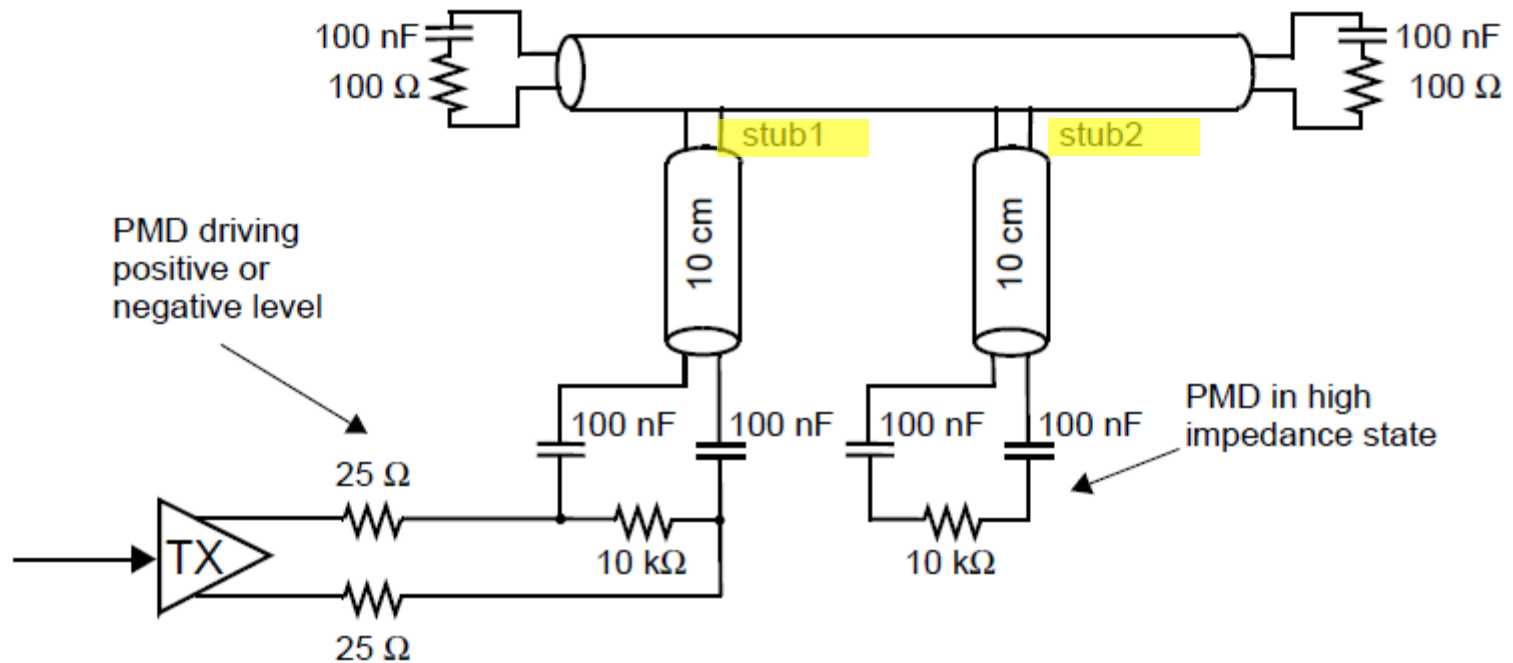

Figure 0-5—Example DME encoding of 5B symbols

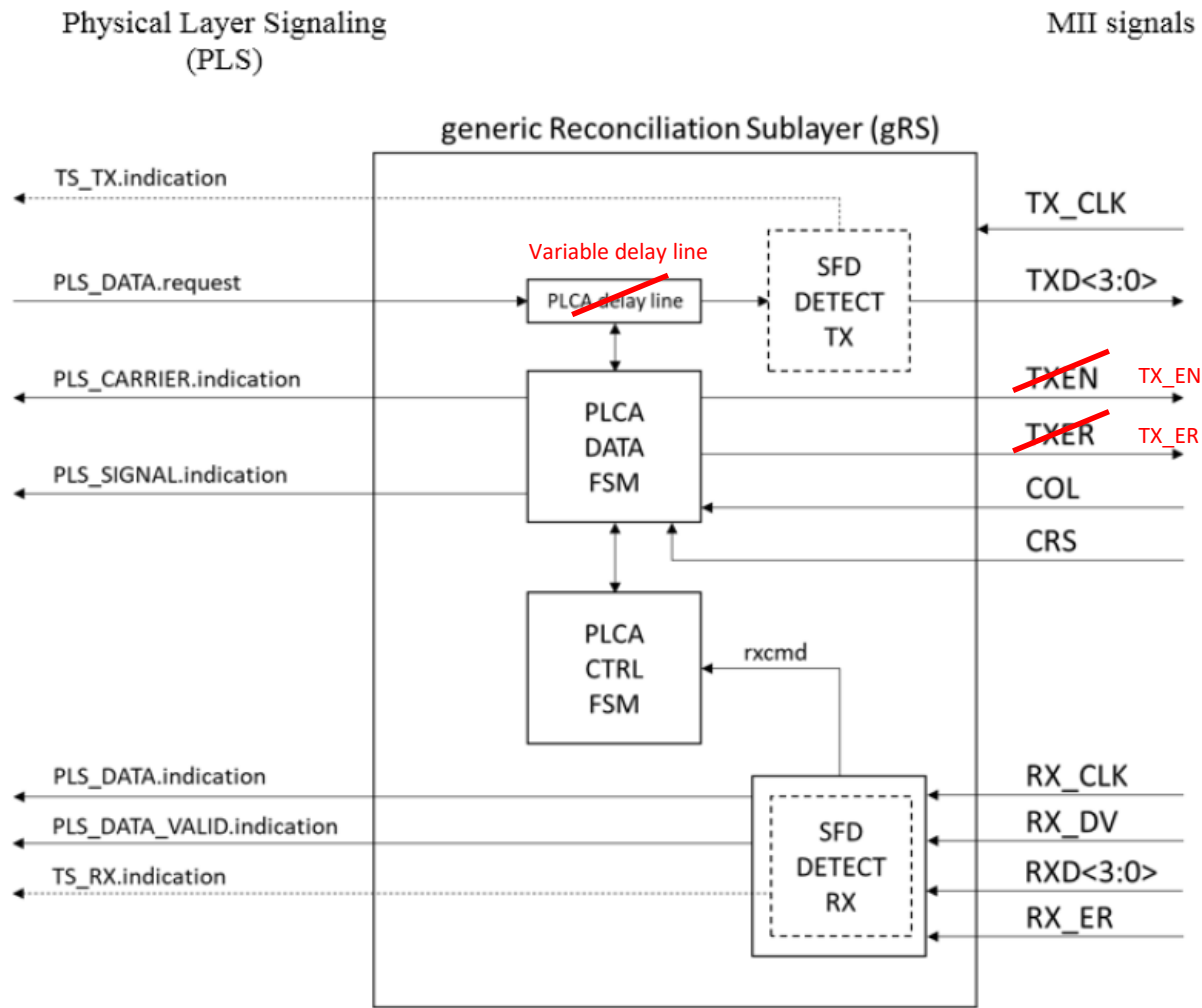

Figure 148-2—PLCA functions within the generic Reconciliation Sublayer (gRS)

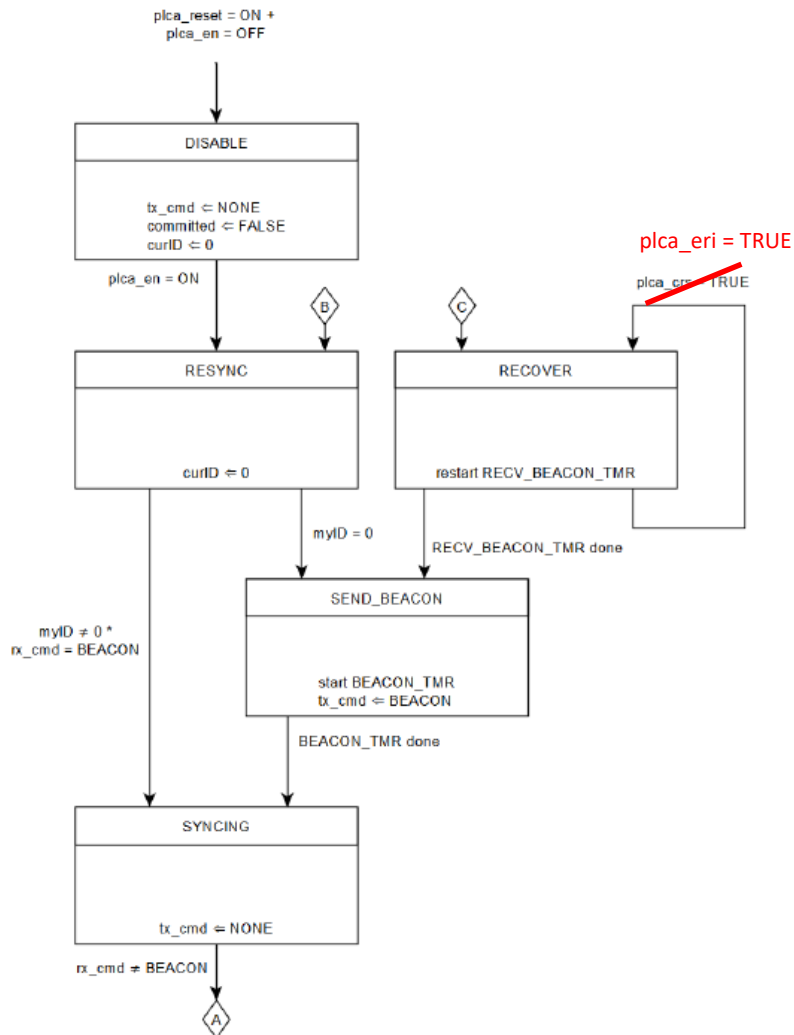

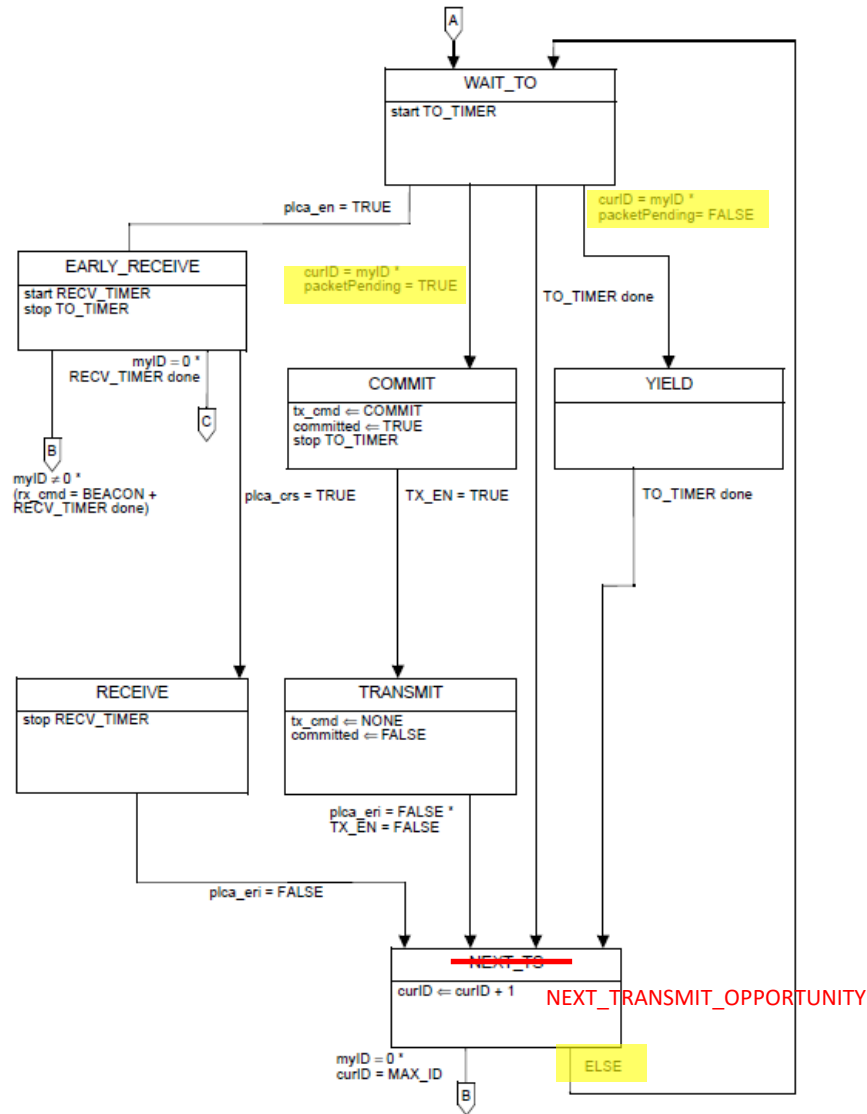

Figure 148-3—PLCA Control state diagram (part 1 of 2)

In figure 148-3, the transition from RECOVER state to RECOVER state should be done whenever some activity is sensed on the media ("plca_eri"), not only when a good receiving is ongoing ("plca_crs"). This to avoid collision when BEACON is sent

Editorial: #118, #119, #120

148.4.5.2:

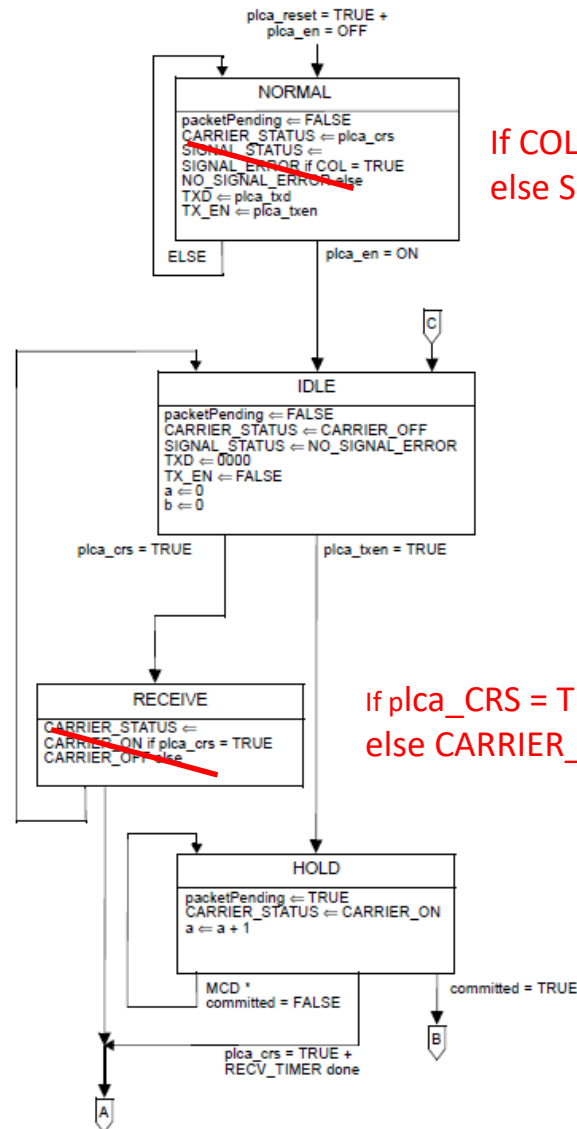

- **MAX_ID** can be left unconfigured on slave devices, myID shall not depend on it

myID

ID representing the PLCA transmit opportunity assigned to the PHY. Generated by the management interface (register TBD). May also be set by the Auto-Negotiation protocol as described in Clause 98. The special value '0' is assigned to the master node, indicating the PHY shall generate BEACON signals.

Values: integer value from 0 (master) to ~~MAX_ID~~255.

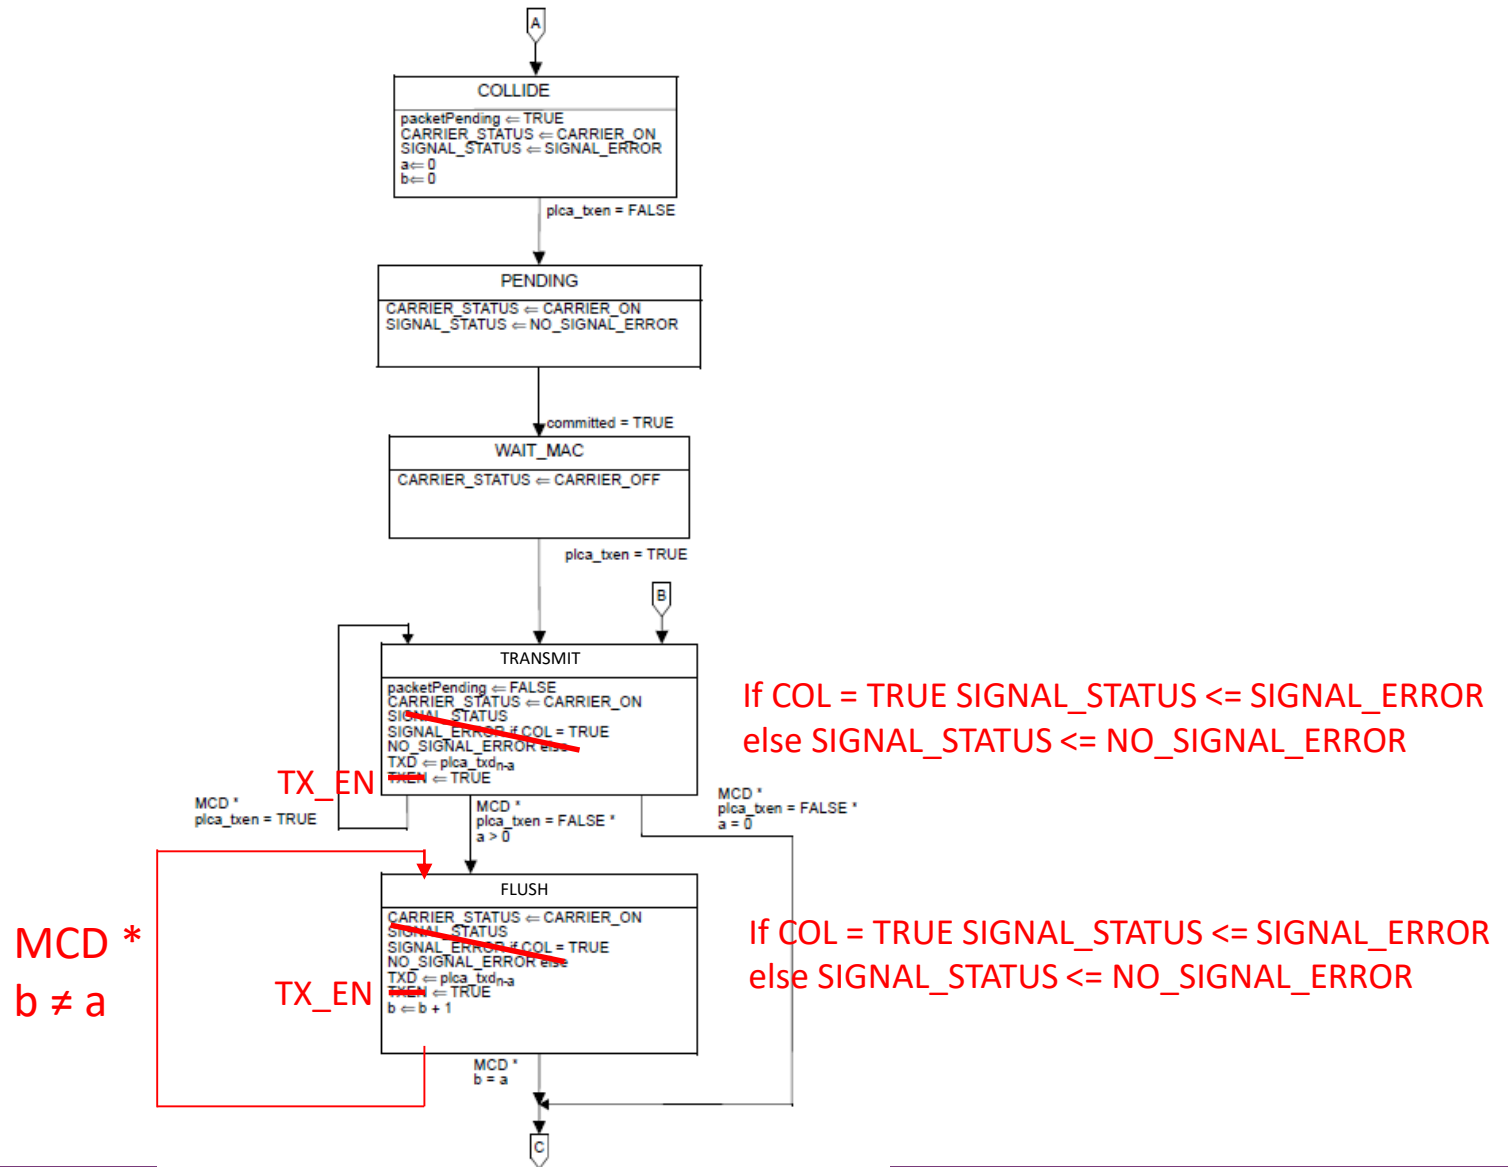

Editorial: #127

If COL = TRUE SIGNAL_STATUS <= SIGNAL_ERROR
else SIGNAL_STATUS <= NO_SIGNAL_ERROR

If plca_CRS = TRUE CARRIER_STATUS <= CARRIER_ON
else CARRIER_STATUS <= CARRIER_OFF"

Editorial: #123, #124, #145

Thank You !
