

Table 4 - Dielectric Insulation levels for all windings of Class II power transformers, and Class I power transformers when partial discharge testing is specifically requested, voltages in kV

Maximum system voltage (kV rms)	Nominal system ^a voltage (kV rms)	Applied voltage test ^g (kV rms)			Induced voltage test ^{b,c} (phase to ground) (kV rms)		Winding line-end BIL ^d (kV crest)				Neutral BIL ^{e,g} (kV Crest)	
		Delta and fully Insulated wye	Grounded wye	Impedance grounded wye or grounded wye with higher BIL	Enhanced 7200 cycles	One hour	Minimum	Alternates		Grounded wye	Impedance grounded wye or grounded wye with higher BIL

550	500	N/A	34	140	550 ^f	475 ^f	1425	1550	1675		110	350
765	735	N/A	34	140	880 ^f	750 ^f	1950 ^f	2050			110	350
800	765	N/A	34	140	885 ^f	795 ^f	1950 ^f	2050			110	350

^aFor nominal system voltage greater than maximum system voltage, use the next higher voltage class for applied test levels.

^bInduced voltage tests shall be conducted at 1.58 x nominal system voltage for one hour and 1.8 x nominal system voltage for enhanced 7200 cycle test.

^cColumn 6 and Column 7 provide phase-to-ground test levels that would normally be applicable to wye windings. When the test voltage level is to be measured phase-to-phase (as is normally the case with delta windings), the levels in Column 6 and Column 7 must be multiplied by 1.732 to obtain the required phase-to-phase induced-voltage test level.

^dBold typeface BILs are the most commonly used standard levels

^eY-Y connected transformers using common solidly grounded neutral may use neutral BIL selected in accordance with the l-voltage winding rating.

^fFor 500 kV to 765 kV nominal system voltages, induced voltage test levels do not follow rules in footnote b, and 1950 kV BIL is not a standard IEEE level.

^gIf user specifies a different BIL for the neutral than indicated above, the applied test voltage shall also be specified.
