

# Link aggregation with TSN

Marius Stanica, ABB

# Use Case. High amount of events support

# Link aggregation

- A high amount of exception reports may be created from various functional units and trying to reach a server (i.e. Operations)
- It would be useful to be able to do link aggregation, in such a case, as one may not really need to change the backbone bridges
- One may advocate the usage of very high end bridges with high bandwidth, but this must not always be the case, we should allow various choices

# Use Case. Event-based control
