

# IEEE 802.1Qcx (CFM) Data Model Update

Marc Holness ([mholness@ciena.com](mailto:mholness@ciena.com))  
Version 0.1  
May 2018

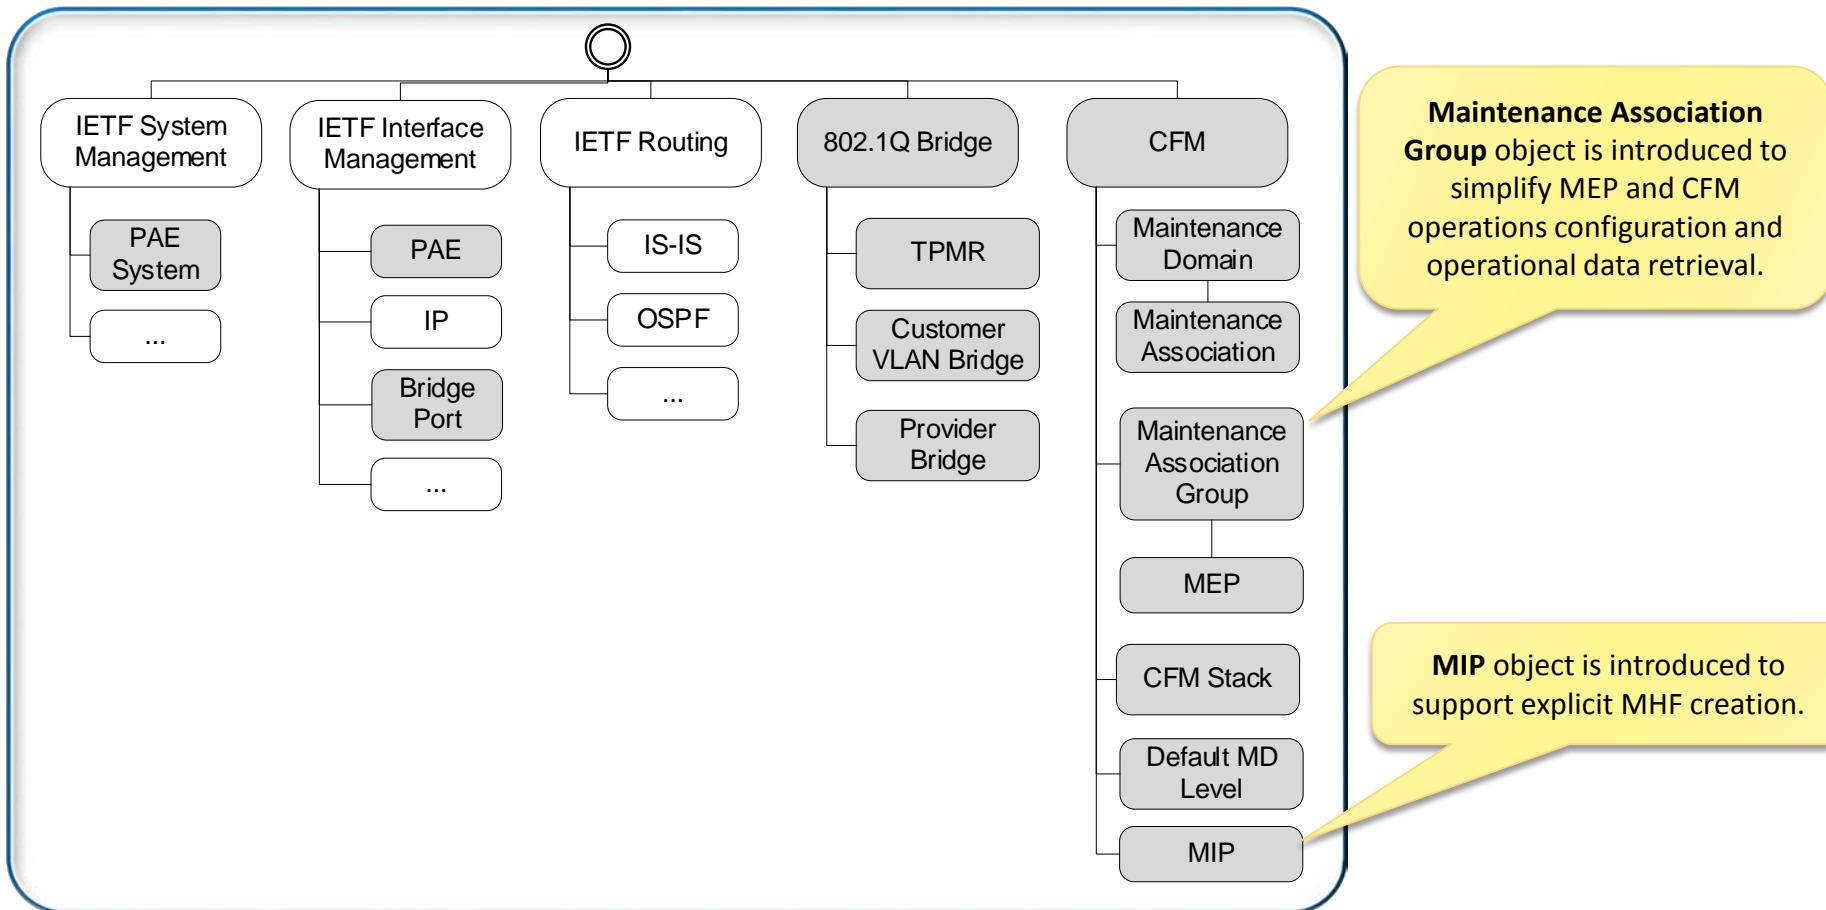

# P802.1Qcx CFM YANG Data Model

- 1) IEEE 802.1Q Bridges
  - The CFM YANG model makes reference to the Bridges YANG modules introduced by 802.1Qcp
- 2) ITU-T Q14/15 developing a G.8052.1 YANG data modeling for Y.1731 Ethernet OAM
  - The (P802.1Qcx) CFM YANG model is structured such that it can be gracefully extended to support G.8052.1 modeling
- 3) BBF that would like to apply CFM to their devices
  - The (P802.1Qcx) CFM YANG model is structured such that it decouples 802.1Q Bridge specifics from the base/generic CFM model
- 4) MEF that would like to revise MEF 38 (and MEF 39)
  - The (P802.1Qcx) CFM YANG model is structured such that it can be augmented to meet the MEF members needs
- 5) Etc.

# YANG Model Relationships

- IEEE 802.1 (P802.1Qcx) CFM data model objects will be on its own branch of the hierarchy
  - Facilitates utilization of CFM data model by devices other than 802.1Q Bridges

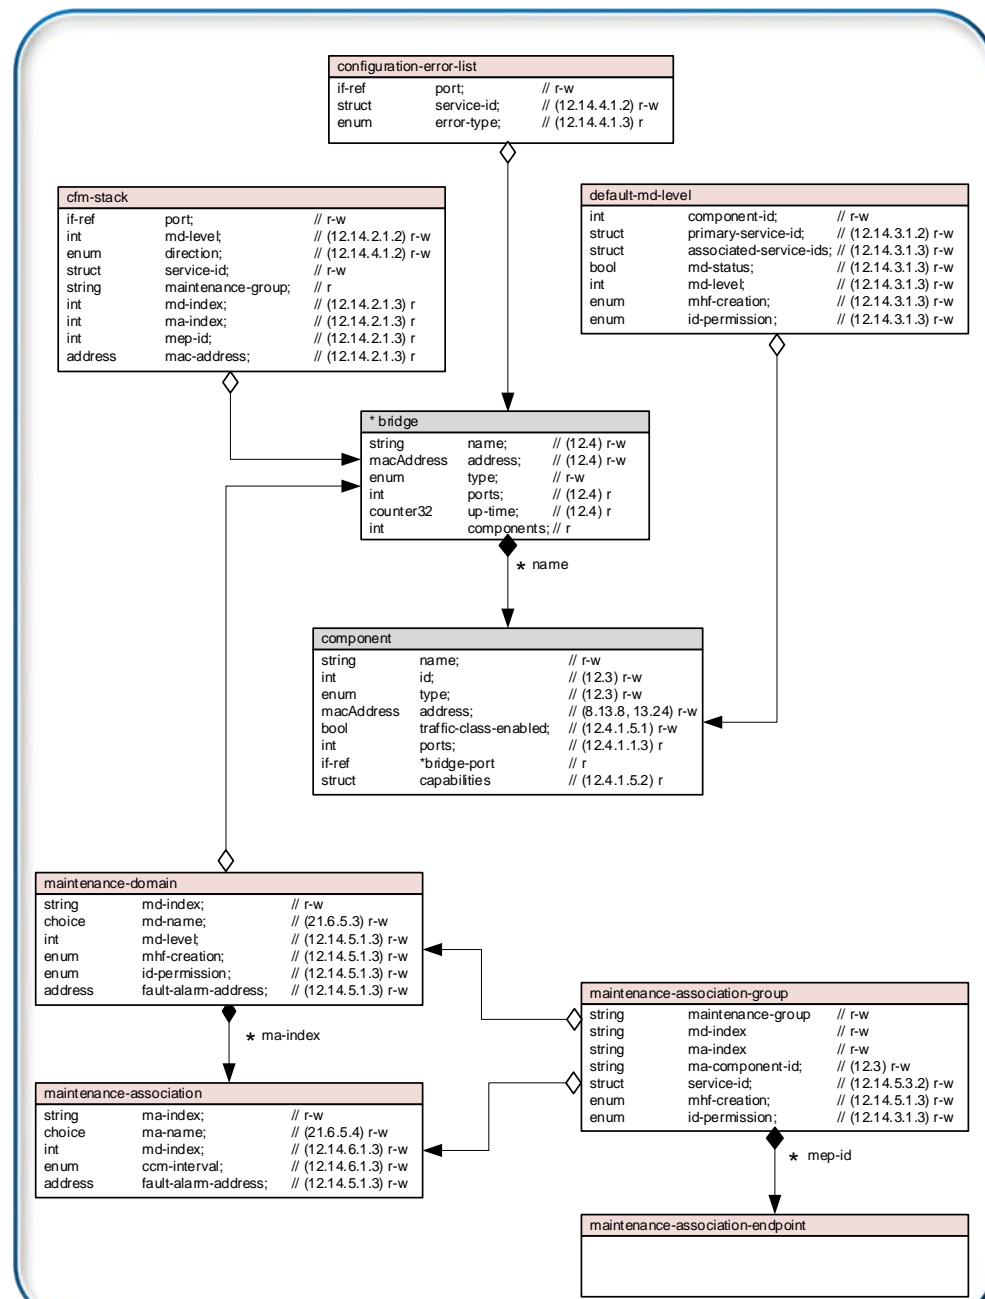

# YANG Module Structure

- Structure of model facilitate a diverse user community to apply the CFM data model

| Module                        | Description  |
|-------------------------------|--|
| ieee802-dot1q-cfm-type.yang   | Type definitions for the overall CFM YANG modules  |
| ieee802-dot1q-cfm.yang        | Generic CFM YANG model structure. This model in this module can be utilized by users that may not be IEEE 802.1Q Bridge compliant. |
| ieee802-dot1q-cfm-bridge.yang | Augmentations and extensions to the generic CFM YANG model that is specific to IEEE 802.1Q Bridges.                                |
| ieee802-dot1q-cfm-mip.yang    | Explicit MIP YANG model structure which is optional.   |

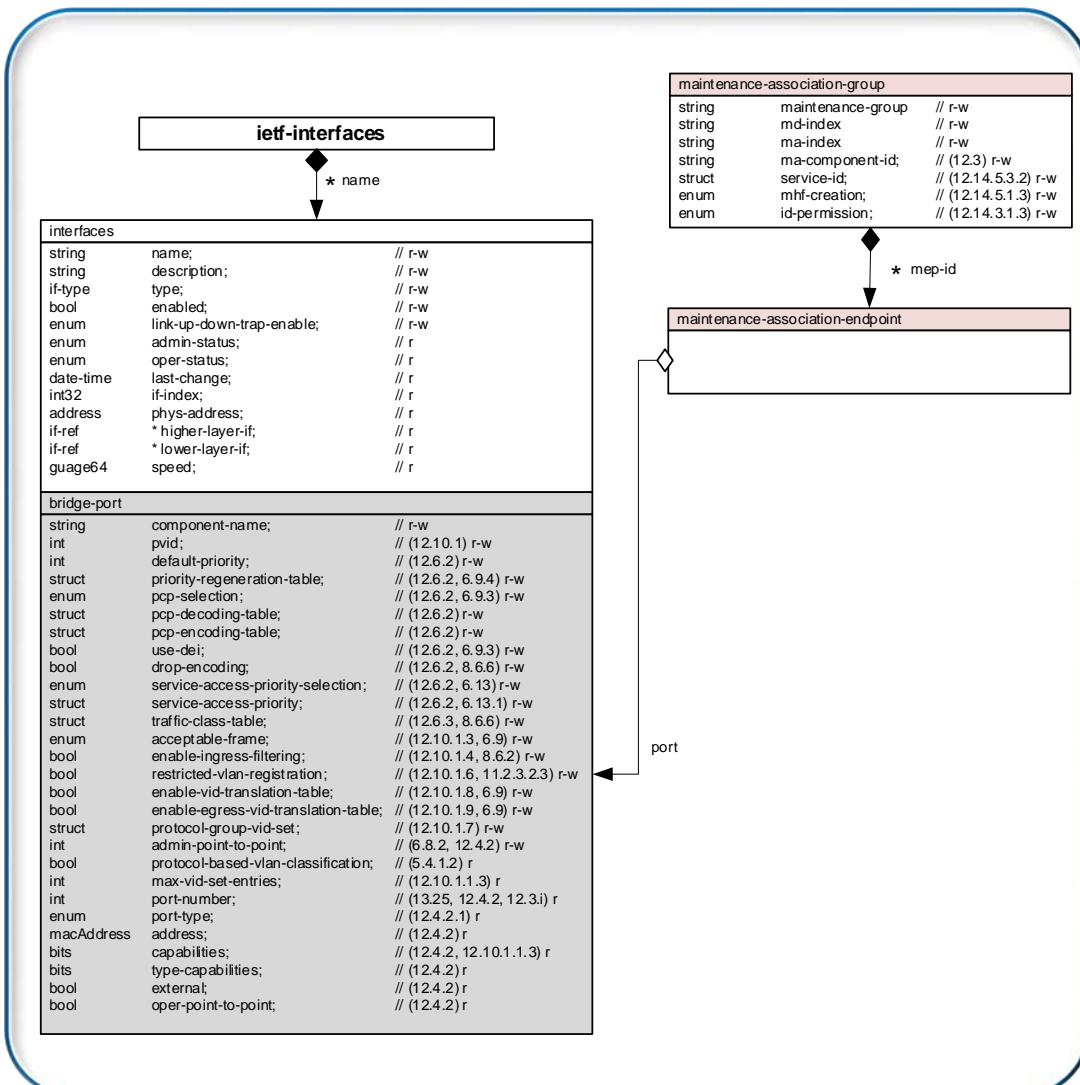

# P802.1Qcx Data Model Relationships

- The cfm-stack, configuration-error-list, and default-md-level objects are related to a device (e.g., Bridge and/or Bridge Component)
- Maintenance-associations are associated with a given maintenance-domain
- The maintenance-group object contains the component specific maintenance-association attributes
  - The maintenance-group object provides a reference to a maintenance-association and maintenance-domain pair
  - The MEP the associated with a maintenance-association-group

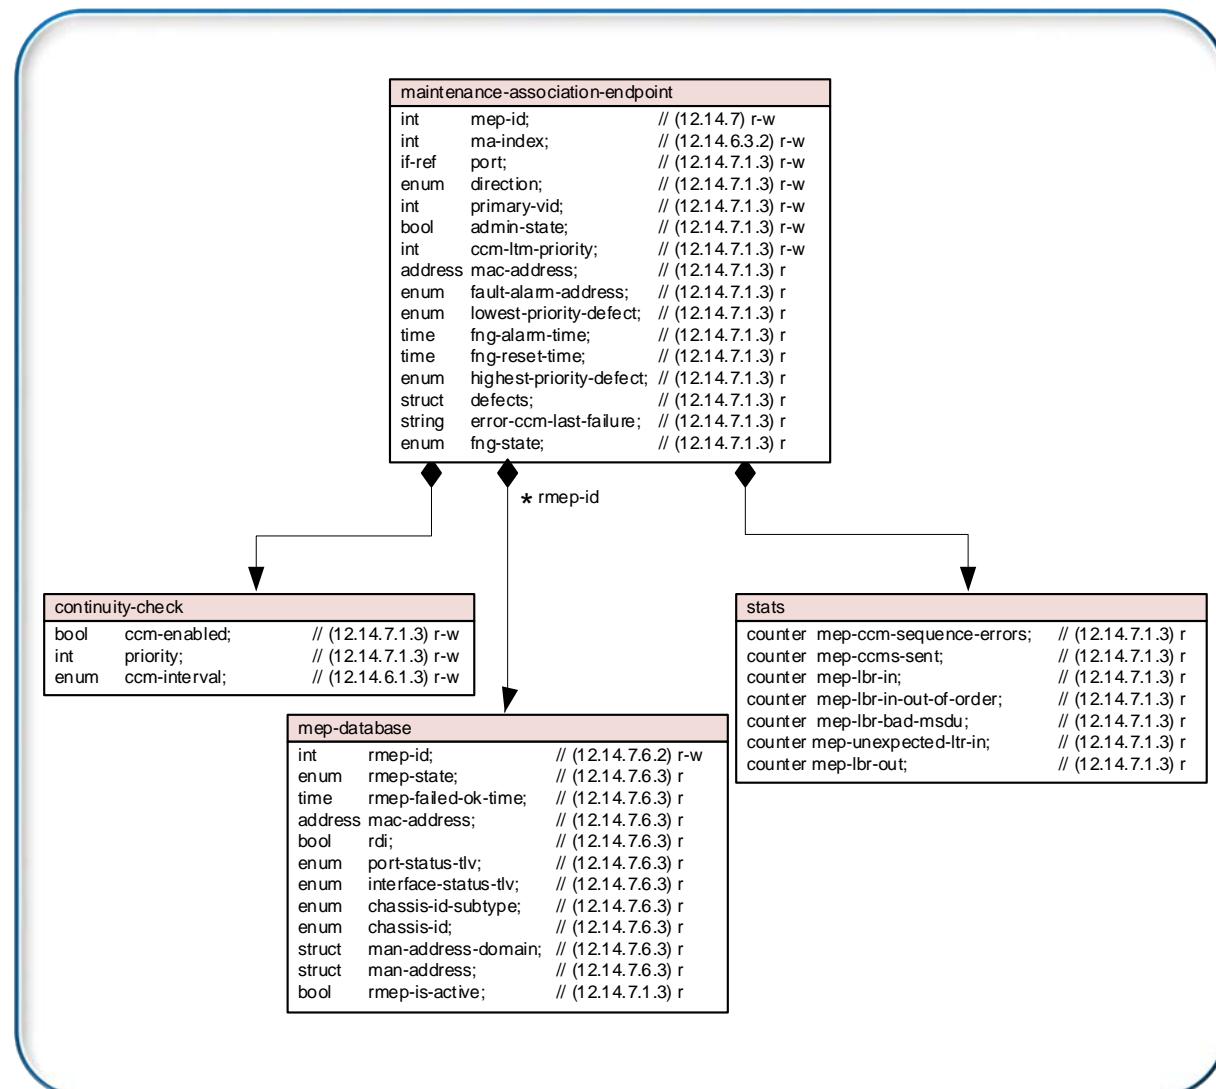

# P802.1Qcx Data Model Relationships

- The MEP is associated with a maintenance-association-group and makes a reference to the Bridge port
- This simplifies MEP creation and state information retrieval since we only need to reference a “maintenance-group” as opposed to *<maintenance-domain, maintenance-association, maintenance-association-component>*
  - This also simplifies CFM operations (e.g., CFM protocol supports) invocations that are related to MEPs

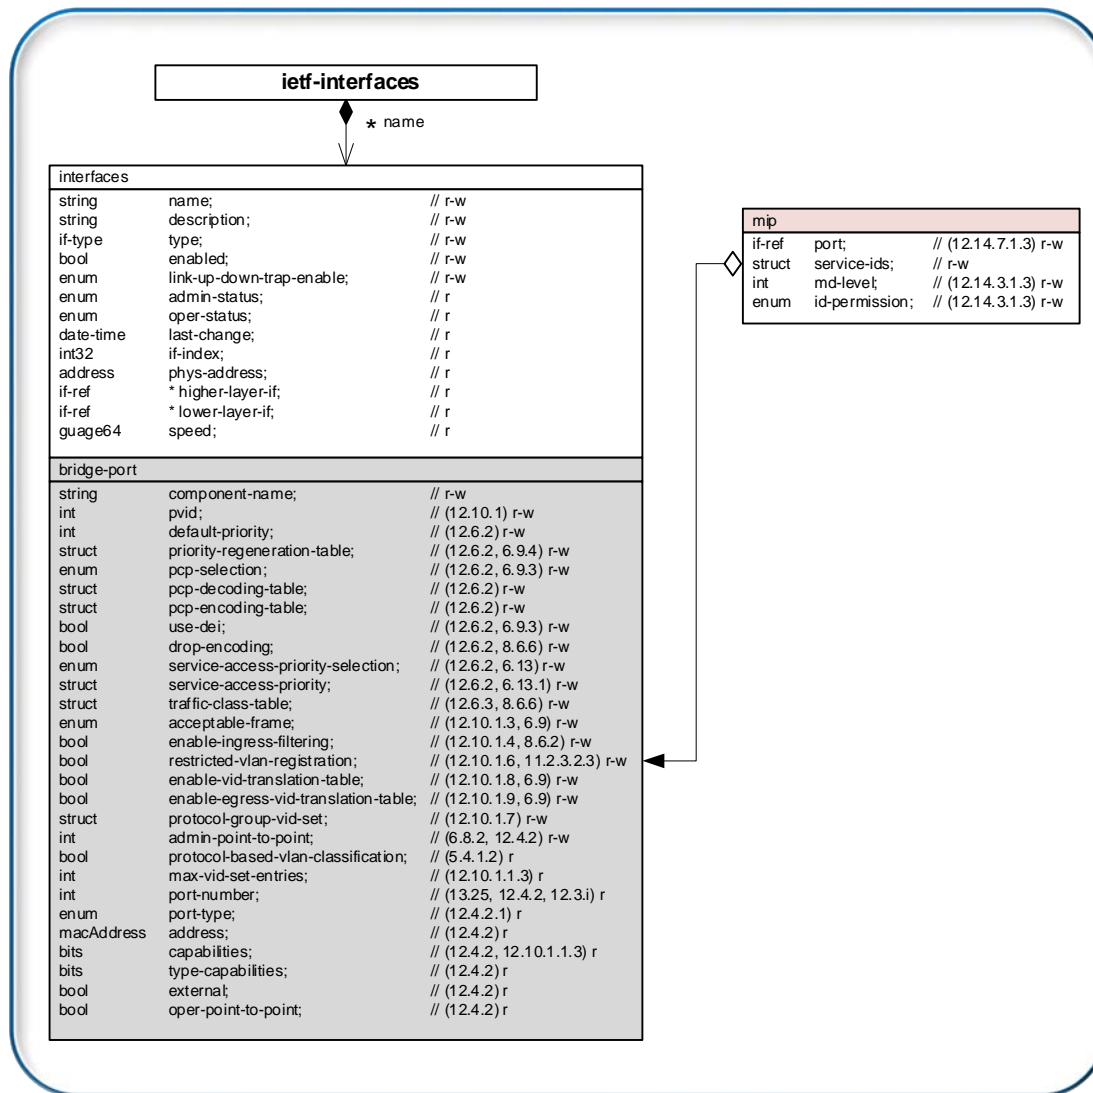

# P802.1Qcx Data Model Relationships

- The MEP is associated with the MEP CCM database and MEP specific stats
- In addition, the CFM continuity-check protocol information is associated with the MEP
  - Only CFM protocols that can be persistently run are explicitly contained under the MEP
  - CFM protocols (e.g., loopback, linktrace) which are not persistent (e.g., on demand) are included in the CFM operation object

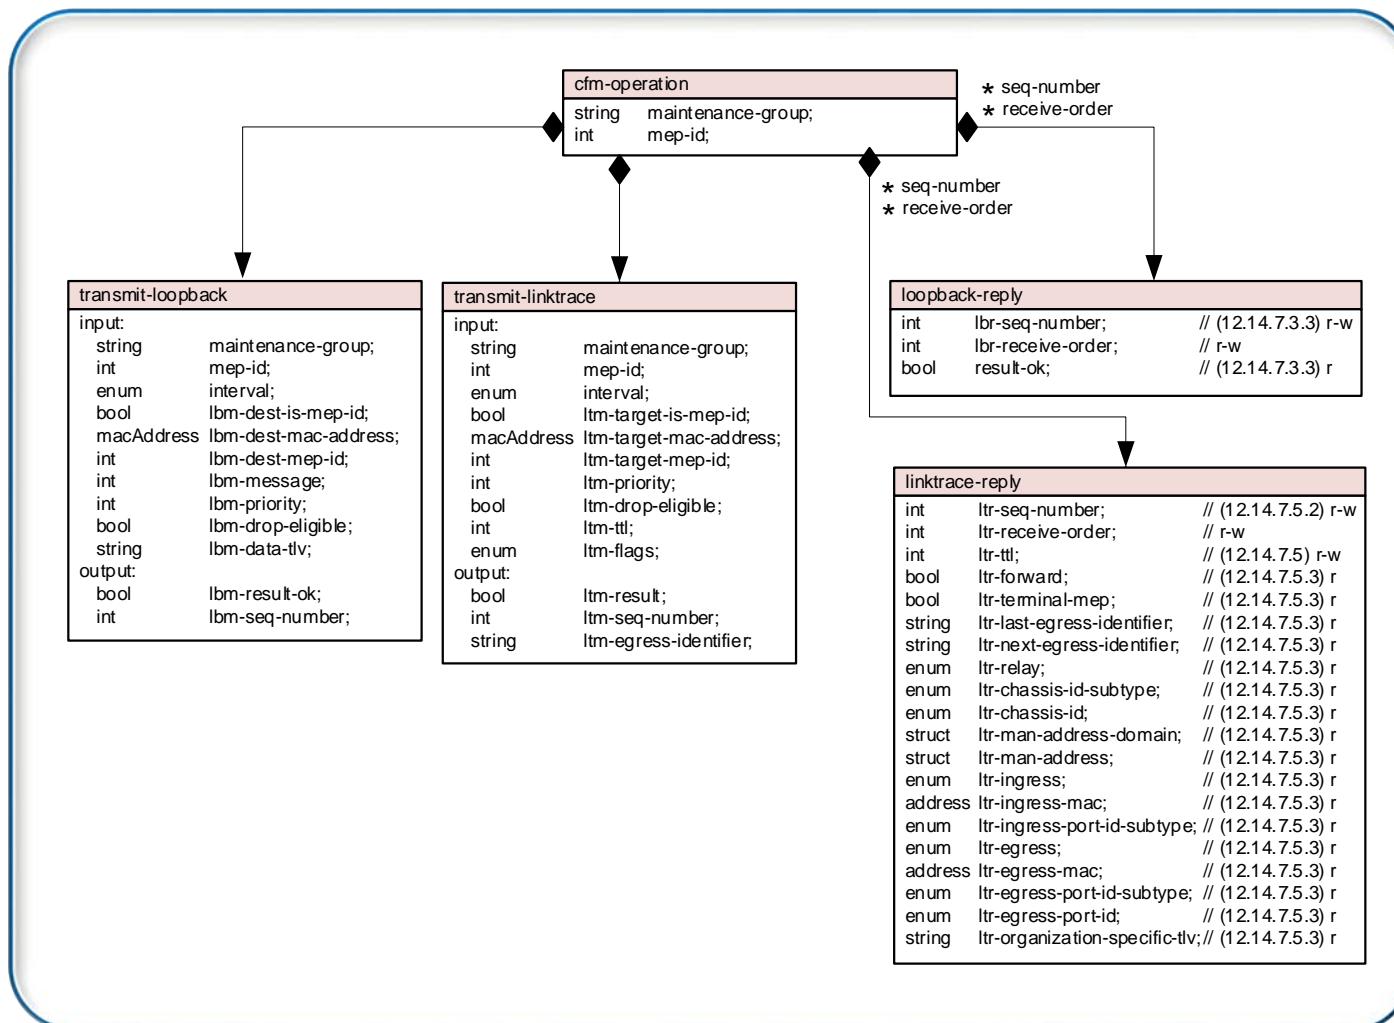

# P802.1Qcx Data Model Relationships

- MIPs can be explicitly created by associating them to an Interface and service

# P802.1Qcx Data Model Relationships

- CFM operations/commands are supported

# P802.1Qcx Project Status

- Current set of CFM YANG modules can be found in GitHub YANG
  - <https://github.com/YangModels/yang/tree/master/standard/ieee/802.1/draft>
- P802.1Qcx D0.3 draft is available for Task Group balloting
  - [802-1Qcx-d0-3.pdf](#)
