

# YANG based Config for MAC Privacy 802.1AE<sup>dk</sup> Questions

Don Fedyk (dfedyk@labn.net)

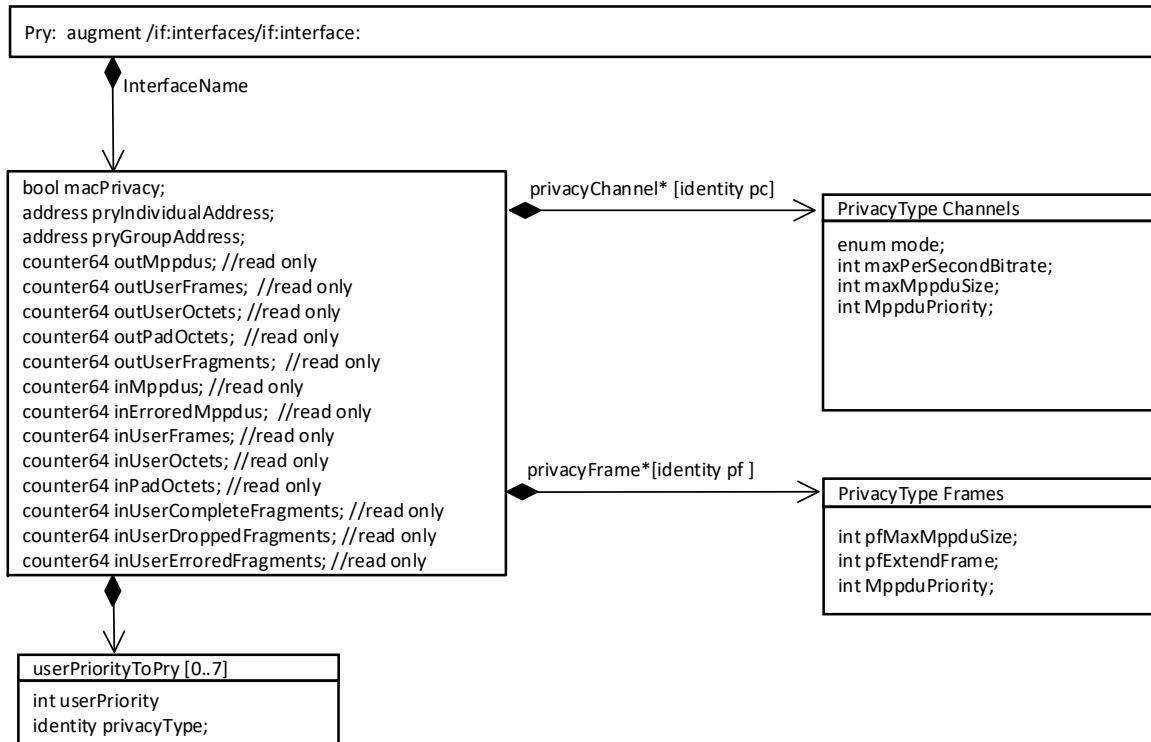

# Outline

- Proto Config for MAC Privacy
- Moving configuration to standard language

# Forward

- This presentation is for a discussion on detailed config.
- It may contain errors/omission and should be consider a work in progress.
- An updated version the presentation will be posted after discussion to correct it but it will remain a work in progress.

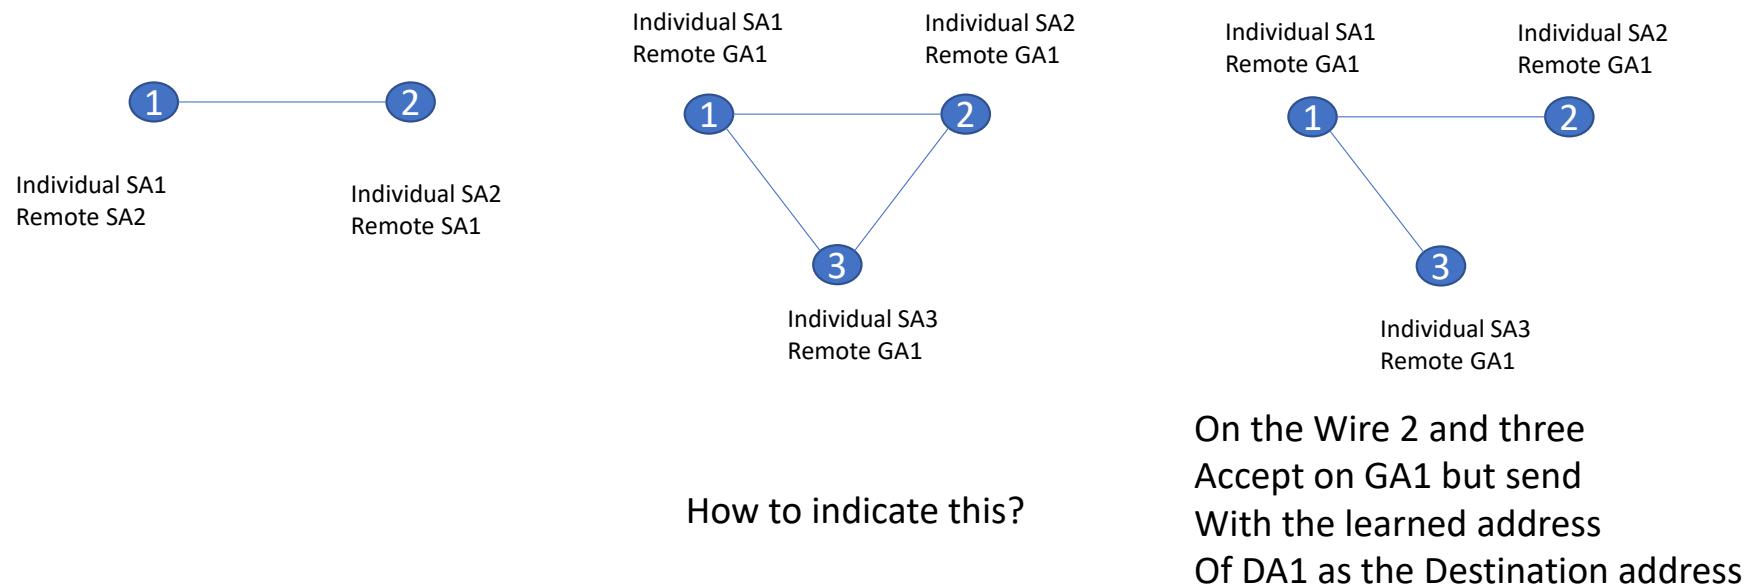

# Current minimal View

# Addressing

- Two options
  - Point to Point
  - Point to Multipoint
- Configuration
  - One individual address for Source and Destination
    - Can it be a chassis MAC shared with other components?
    - Propose Yes it has and EtherType so the Frames are identified by MAC DA and Ethernet type
    - How to configure a shared address?
  - One address for the destination.
    - Either a remote individual address or
    - A shared group address?
- How is misconfiguration prevented?
  - MACsec can help when collocated provides authentication
  - When not collocated is it an issue?

# Addressing – Only SA and DA or ?

# How is traffic mapped to the Bypass port?

- Current mapping uses ingress Port/VLAN to component.
- We should be able to finer grain classifiers to steer traffic to the bypass port.

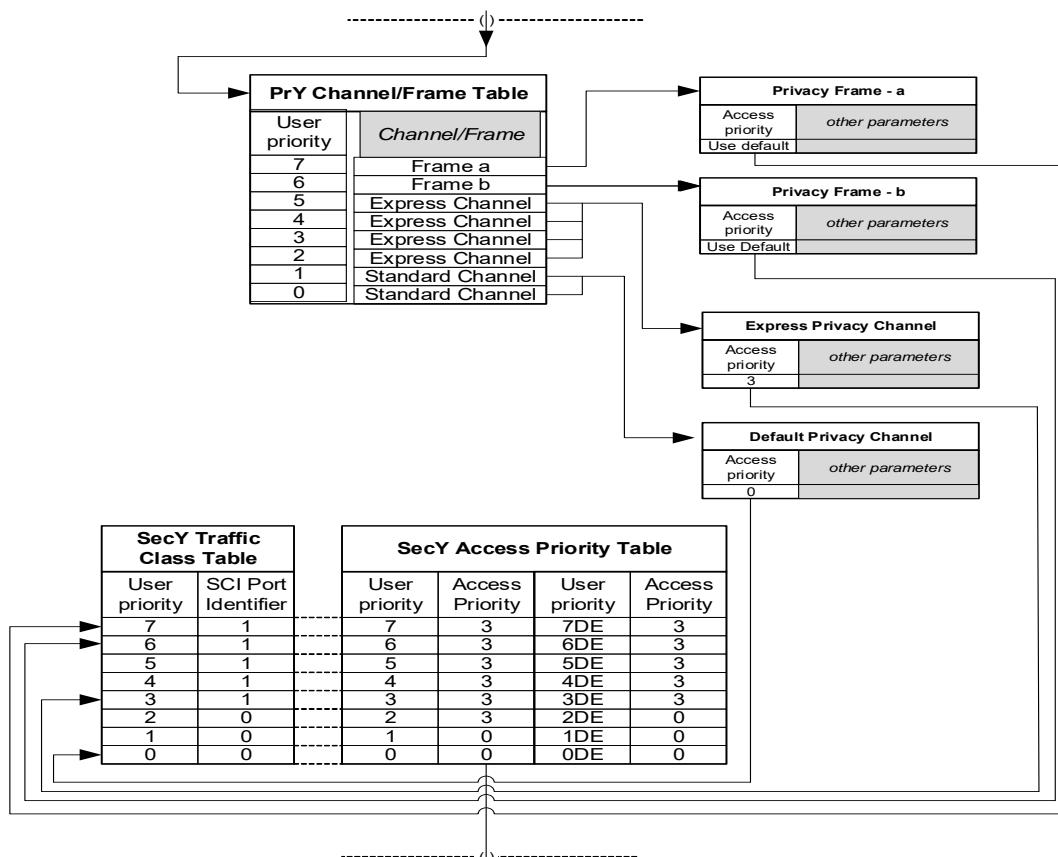

# Privacy Channel Config

- maxFrameSize;
  - Cannot accept frames larger than this (is overhead included)
- maxPerSecond Bitrate – useful to enforce bandwidth Applications can auto adjust below this level.
- MppduPriority
  - DE can be transparently passed through unless multiple user frames are included in the MPPDU

# Privacy Frame Config

- **MaxMppduSize;**
  - Cannot accept frames larger than this (is overhead included)
- **MinMppduSize;**
  - Standard states minimum only
- **ExtendFrame;**
  - Standard recommends only
- **MppduPriority**
  - DE can be transparently passed through unless multiple user frames are included in the MPPDU
