

# Master / Slave Terminology in P1588e and P802.1ASdn

Rodney Cummings

Affiliation: National Instruments (NI)

---

# Status Update

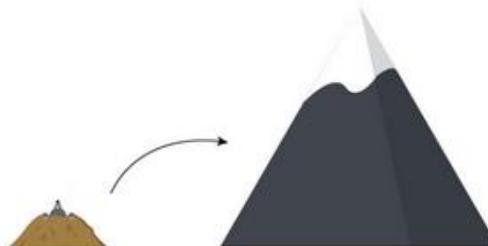

- In P802.1ASdn PAR:  
"YANG data model in this amendment augments the YANG for IEEE Std 1588, contained in amendment IEEE P1588e"
- 1st draft of P1588e (D0.1) in comment resolution
  - About half of 802.1AS clause 14 nodes are in P1588e YANG
  - In effect, P802.1ASdn balloting is underway
- When start ballot for 1st draft of P802.1ASdn (other half)?
  - Planning on starting work after P1588e D0.1 comment resolution

# Master/Slave Terminology: Overview

- Handful of uses
  - E.g., experimental P802.1ASdn has ~10, all in description
- Not a big problem unless...

**make a mountain out of a molehill**

exaggerate the importance or significance of a problem/issue

---

# Decision for 802.1

- How ideological does 802.1AS want to be regarding use of "master" and "slave" in P1588e YANG?
- Option 1: As long as P802.1ASdn YANG doesn't use "master" or "slave", it is okay if P1588e YANG uses those terms
  - P802.1ASdr specifies replacement in descriptions... done
- Option 2: Any node in P1588e that is specified in 802.1AS clause 14 cannot use "master" or "slave"
  - Biggest issue is probably port-state leaf. P1588e would need to specify using identity, so P802.1ASdr can add leader / follower
- Option 3: Nothing in P1588e can use "master" or "slave"

# Thank You
