$\begin{array}{ll}\text { Abstract: } & \text { This paper proposes a tightening up of the definition of bit ordering } \\ \text { within IEEE 802.11. }\end{array}$

## 1. Introduction

I have taken the bit order principle from the IEEE 802.3 standard (section 3.3), which I have copied almost word-for-word.
I have worked from reference document [1], section 4.1, Basic Frame Format.

## 2. Proposed Additions to the IEEE 802.11 specification document

### 2.1. Order of Transmission

Each octet of the MAC frame, with the exception of the Cyclic Redundancy Check (CRC), is transmitted low-order bit first, which is bit 0 .

### 2.2. Type field format

Sub Type bits 0 to 3,
Compressed bit 4,
Encrypted bit 5,
Type bits 6 and 7 .

### 2.3. Control Field Format

From AP bit 0,
To AP bit 1,
Retry bit 2,
Power Management Mode bits 3 and 4,
Elements present bit 5,
More bit 6,

Poll bit 7,
CF ACK bit 8.
2.4 NID Format

BSSID bits 0 to 9 ,
ESSID bits 10 to 22,
Infra-structure bit 23.

### 2.5. Frame Format Diagram

Control Field Format

## 3. Conclusion

I would like the following motion to be made that:
"All the changes proposed above be made to the IEEE 802.11 draft specification".
