# Configuration of DQPSK-OFDM System

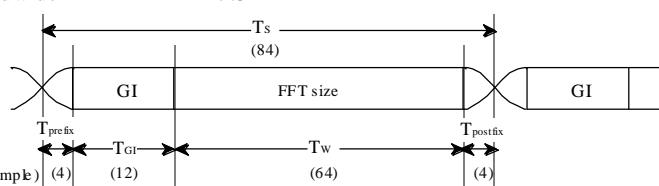

Submission

page 2

Hitoshi Takanashi, NTT Wireless Systems Laboratories

## Major Parameters

Raw data rate	20Mbit/s
Modulation	DQPSK-OFDM
Coding rate	3/4
FFT size	64
Number of sub-carriers	48 (FFT oversampling ratio: 1.33)
Guard interval (GI)	12 samples (5 times of RMS delay spread (100ns))
Number of Tprefix samples	4 samples (correspond $\alpha=0.1$ )
Symbol duration (TS)	84 samples ( $=3.6\mu s$ )
Baseband clock rate	23.33 MHz
OFDM Bandwidth	17.5 MHz

## Characteristics of solid state power amplifier

$$g[A] = \frac{v_k A}{\left(1 + \left(\frac{v_k A}{A_0}\right)^{2p_k}\right)^{\frac{1}{2p_k}}}$$

$$F[A] = 0$$

 $g[A]$ : Input and output amplitude function $F[A]$ : Input and output phase function $v_k$ : Small-signal gain $p_k$ : Parameter of smoothness $A_0$ : Output amplitude at saturation point

## Conclusions

- Delay spread of 400 ns and more is tolerable by employing DQPSK-OFDM
- OBO of 4 or 5 dB is enough
- Spectrum allocation of HIPERLAN can be adopted
- Required Eb/No is 20 dB in a Rayleigh Fading channel
  - Propagation loss up to 92 dB in a Rayleigh Fading channel
