On page 110 line 24 we have a definition of Idpc_two_frame_done as the point aligned to the inversion on pair A during PMA training
However on page 99 line 49 and page 124 line 7 the term "even LDPC frame boundary" is used. Is this precise enough to avoid ambiguity?

## SuggestedRemedy

page 99 line 49
change "If the sleep signal begins on an even LDPC frame boundary,"
to "If the sleep signal begins on an even LDPC frame boundary aligned to the inversion on pair A during PMA training,"
page 124 line 7
change "The link failure signal is sent for 8 LDPC frames and begins on an even LDPC frame boundary."
to "The link failure signal is sent for 8 LDPC frames and begins on an even LDPC frame boundary aligned to the inversion on pair A during PMA training."

Comment Type TR Comment Status D XGMII
For 2.5GBASE-T PHYs the link fault signaling state diagram described in 46.3 .4 is only necessary to signal link interruption for fast retrain. Seeing as fast retrain is optional,
implementation of the link fault signaling should be optional also.
Making link fault signaling optional would allow speeded up SGMII implementations to be used to connect to 2.5GBASE-T PHYs allowing better inter-operability with existing ASIC implementations.

Also the requirement to implement the link fault state machine adds extra complexity to the ASIC attached to the 2.5GBASE-T PHY.

## SuggestedRemedy

Add an extra sentence to the end of this paragraph so it reads:
"The $2.5 \mathrm{~Gb} / \mathrm{s}, 5 \mathrm{~Gb} / \mathrm{s}$, and $10 \mathrm{~Gb} / \mathrm{s}$ Physical Coding Sublayers (PCS) are specified to the XGMII, so if not implemented, a conforming implementation shall behave functionally as if the RS and XGMII were implemented. For $2.5 \mathrm{~Gb} / \mathrm{s}$ and $5 \mathrm{~Gb} / \mathrm{s}$ data rates implementation of link fault signaling as described in 46.3 .4 is optional."

Bring subclause 46.3 .4 into 802.3bz and change the last sentence from:
"The RS shall implement the link fault signaling state diagram (see Figure 46-11)."
To:
"The RS shall implement the link fault signaling state diagram (see Figure 46-11) for data rates of $10 \mathrm{~Gb} / \mathrm{s}$ and above. For $2.5 \mathrm{~Gb} / \mathrm{s}$ and $5 \mathrm{~Gb} /$ s data rates implementation of the link fault signaling state diagram is optional."

## Proposed Response Response Status w

PROPOSED ACCEPT IN PRINCIPLE
Task force to discuss tradeoffs and consider the potential remedy for $2.5 \mathrm{~Gb} /$ s only. See presentation
http://www.ieee802.org/3/NGEBASET/public/archadhoc/marris_3bzah_1_0616.pdf
Potential remedy text:
Add an extra sentence to the end of this paragraph so it reads:
"The $2.5 \mathrm{~Gb} / \mathrm{s}, 5 \mathrm{~Gb} / \mathrm{s}$, and $10 \mathrm{~Gb} / \mathrm{s}$ Physical Coding Sublayers (PCS) are specified to the XGMII, so if not implemented, a conforming implementation shall behave functionally as i the RS and XGMII were implemented. For the $2.5 \mathrm{~Gb} / \mathrm{s}$ data rate, implementation of link
fault signaling as described in 46.3.4 is optional."
