Try to base budget on established stds

- The ITU-T G.652 fiber spec suggests that 0.5 dB/km is a good planning value for installed cabled fiber (at 1260nm)
 - Typically, the fiber itself is considerably better than this
 - This includes typical splicing losses, and all other loss aspects
- ITU-T G.671 fiber component spec suggest 0.5 dB as worst case connector loss
 - Typically, connectors are significantly better than this, so there is margin hidden inside of this number

Proposed losses for our distance objectives

- BR10: $10 * 0.5 + 4 * 0.5 = 7$ dB (a bit harder than LR specs)
- BR20: $20 * 0.5 + 6 * 0.5 = 13$ dB (a bit easier than ER specs)
- BR40: $40 * 0.5 + 6 * 0.5 = 23$ dB (a lot harder than ER spec)
- Question: can we agree to use these budgets?
- One side issue is 10G BR40: We could operate in the C-band
 - The C-band loss is 0.35 dB/km
 - This would make the loss budget $40 * 0.35 + 6 * 0.5 = 17$ dB
 - 17 dB is actually a bit easier than ER
- Question: do we want to go for 10G BR40 in the c-band?
 - E.g., Downstream 1570 nm, upstream 1510 nm
