

# Outlines

- Introduction
- TDECQ vs. OMA, Averaged Power and ER for low cost consideration
- Overshoot considerations due to pre-emphasis
- Summary

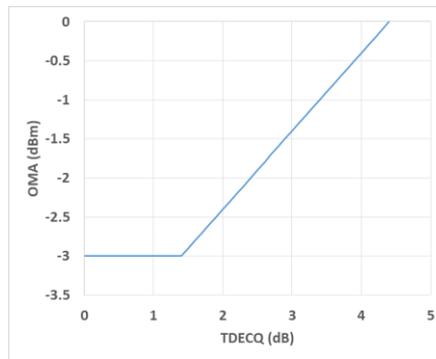

# Introduction

- There are 6+ main TBDs left in D0.1. The main goal is to balance Tx and Rx for low cost.
- The TDECQ vs. averaged power is analyzed in this work to add extra dimension for low cost consideration.
- The overshoot was proposed to limit the penalty of error floor in 802.3cu (rodes\_3cu\_01a\_052620).
- The effect of pre-emphasis on overshoot is investigated in the following slides.

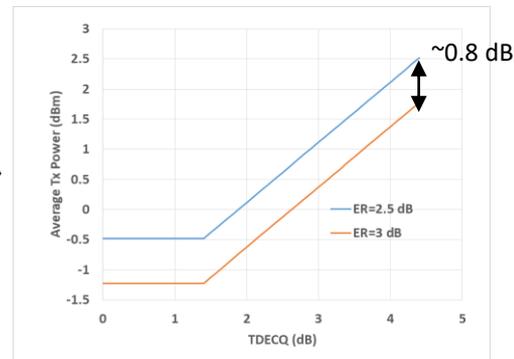

# TDECQ vs. OMA, Averaged Power and ER for low cost

Transmitter excursion, each lane (max)	2		dBm
Transmitter overshoot/undershoot as a fraction of $OMA_{outer}$	TBD	TBD	
Launch power in $OMA_{outer}$ minus TDECQ (min)	TBD	-4.4	dBm
TECQ, each lane (max)	TBD	4.4	
TDECQ, each lane (max)	TBD	4.4	dB
Average launch power of OFF transmitter, each lane (max)	-30		dB
Extinction ratio, each lane (min)	2.5		dB

Murty\_3db\_01\_021821

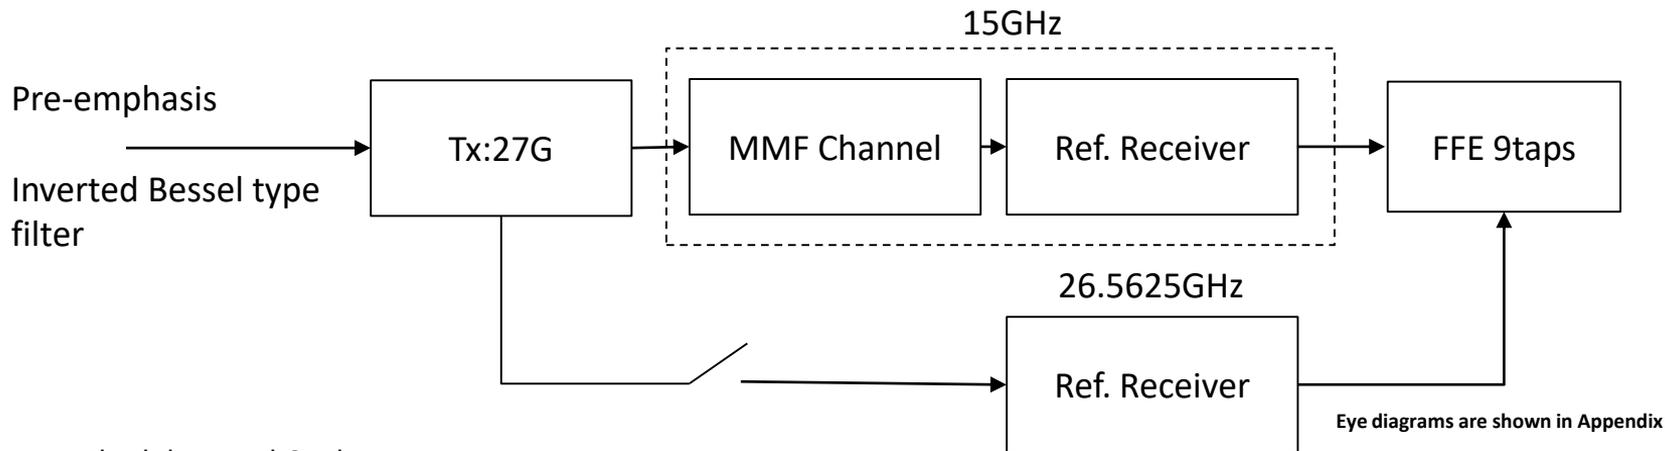

TDECQ vs. OMA

TDECQ vs. Averaged Power

- 0.5 dB ER relaxation results in 0.8 dB higher requirement on LD averaged power at same TDECQ value.
- Suggest to take into account feasibility of VCSEL averaged power while considering low cost. Balance between Tx and Rx. (Of course it is vender's freedom to design the module solution )

# Overshoot considerations due to pre-emphasis (1)

## Methodology and Goal:

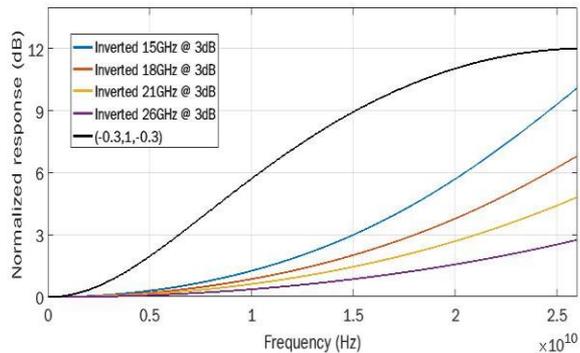

- The simulation/analysis is mainly for effect of pre-emphasis on overshoot before and after fiber. The VCSEL impairment (eye-skew, oscillation relaxation, nonlinear L-I curve) should be investigated to match overshoot of Tx.
- The  $C_{eq}$  is calculated as follow with  $N(f)$  bandwidth equal to **26.5625GHz**, with FFE taps equal to 9.

$$C_{eq} = \sqrt{\int_f N(f) \times |H_{eq}(f)|^2 df}$$

- Scan the pre-emphasis strength to investigate the overshoot before and after fiber.

# Overshoot considerations due to pre-emphasis (2)

- If pre-emphasis is aimed to compensate the MMF channel, a large overshoot would occur before fiber.
- If pre-emphasis is aimed to compensate the device, there might be >1 dB residue ISI penalty after fiber.
- Suggest to monitor the overshoot/undershoot parameters both at obtb and at longest reach.
- Suggest to have more investigations on overshoot to limit penalty of error floor (rodes\_3cu\_01a\_052620).

Normalized pre-emphasis frequency response

Pre-emphasis 3dB BW	Response BW =15 GHz		Response BW =26.5625 GHz	
	Ceq (dB)	Overshoot	Ceq (dB)	Overshoot
15G	0.2	3%	-1.2	51%
18G	0.8	<3%	-0.6	16%
21G	1.3	NA	-0.1	5%
27G	1.8	NA	0.3	3%
(-0.3,1,-0.3)	-0.4	15%	-1.6	>50%

# Summary

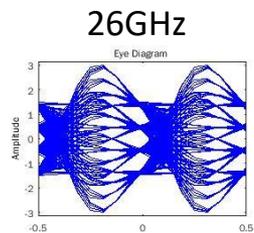

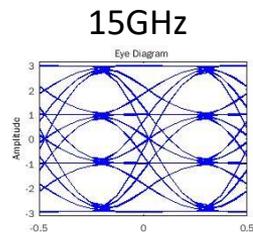

- Suggest to take into account feasibility of VCSEL averaged power while considering low cost.
- The effect of pre-emphasis on overshoot is investigated using simplified model. Suggest to monitor the overshoot/undershoot parameters both at obtb and at longest reach.
- Suggest to have more investigations to limit overshoot concerns.

**Thank you**
