

Gigabit PCS for PAM 3x3

Kelly Coffey

Lucent Technologies

IEEE 802.3z Plenary Meeting Vancouver

November 12, 1996

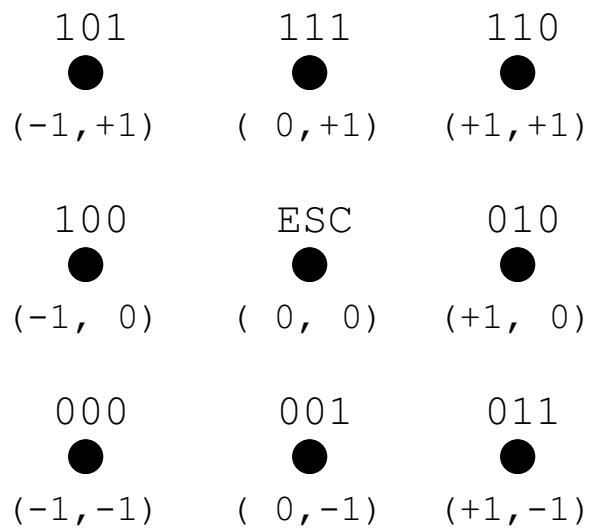

Objectives

- Support the CSMA/CD MAC
- Support GMII, Repeaters, Auto-Negotiation
- Provide 1000Mb/s data rate at GMII
- Full Duplex Operation
- Simple Implementation

Digital Mapping to PAM 3 x 3

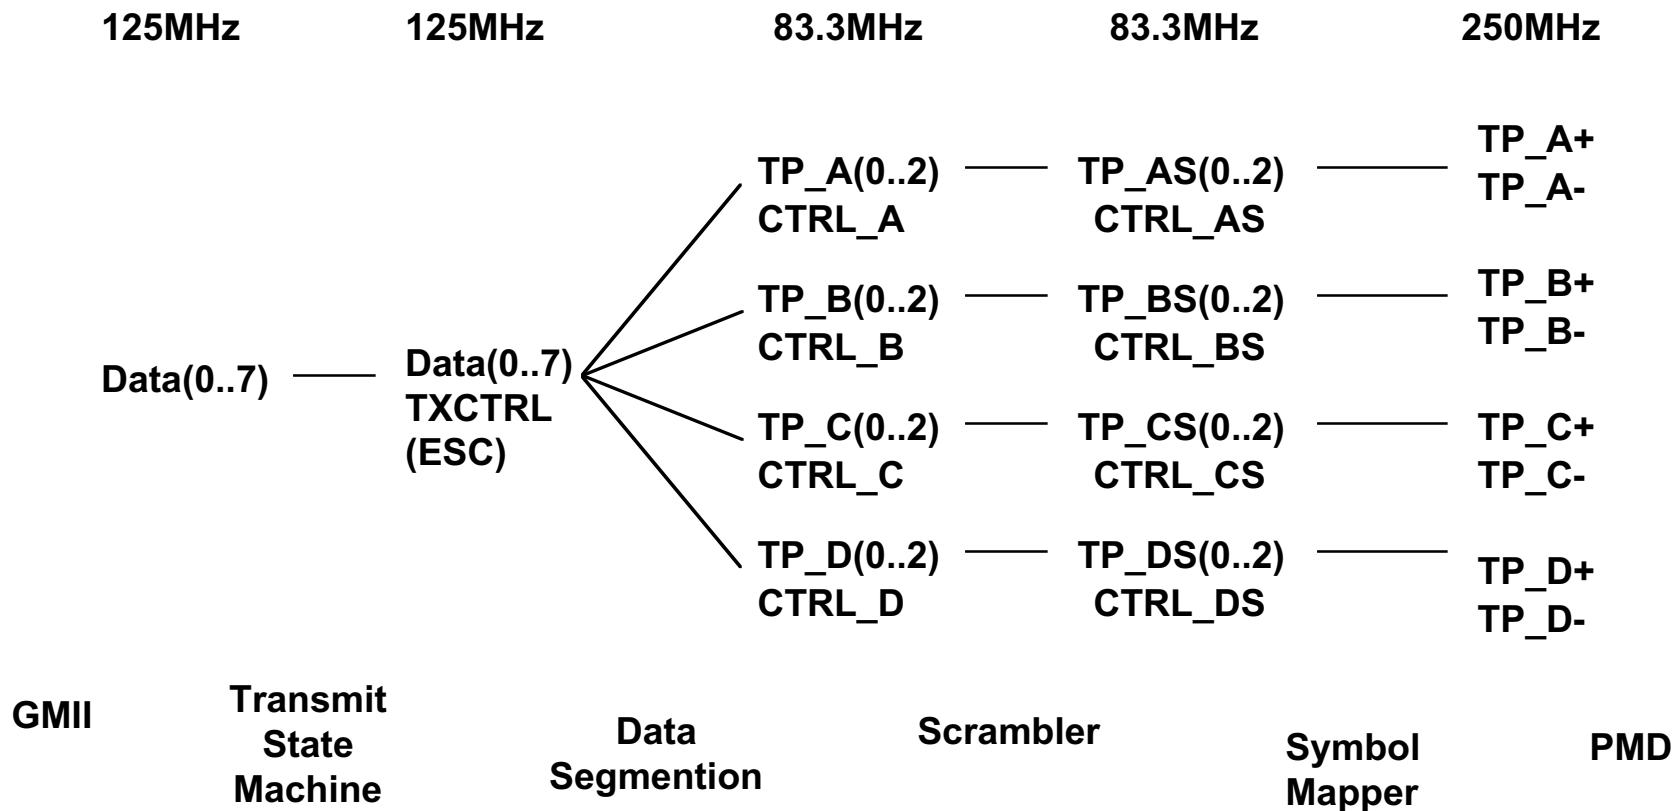

Data	I	Q
(000)	(-1, -1)	
(001)	(0, -1)	
(011)	(-1, 0)	
(010)	(-1, 1)	
(110)	(+1, 0)	
(111)	(+1, -1)	
(101)	(+1, +1)	
(100)	(0, +1)	
(ESC)	(0, 0)	

(Before Scrambling)

Digital Perspective of Transmit Data Path

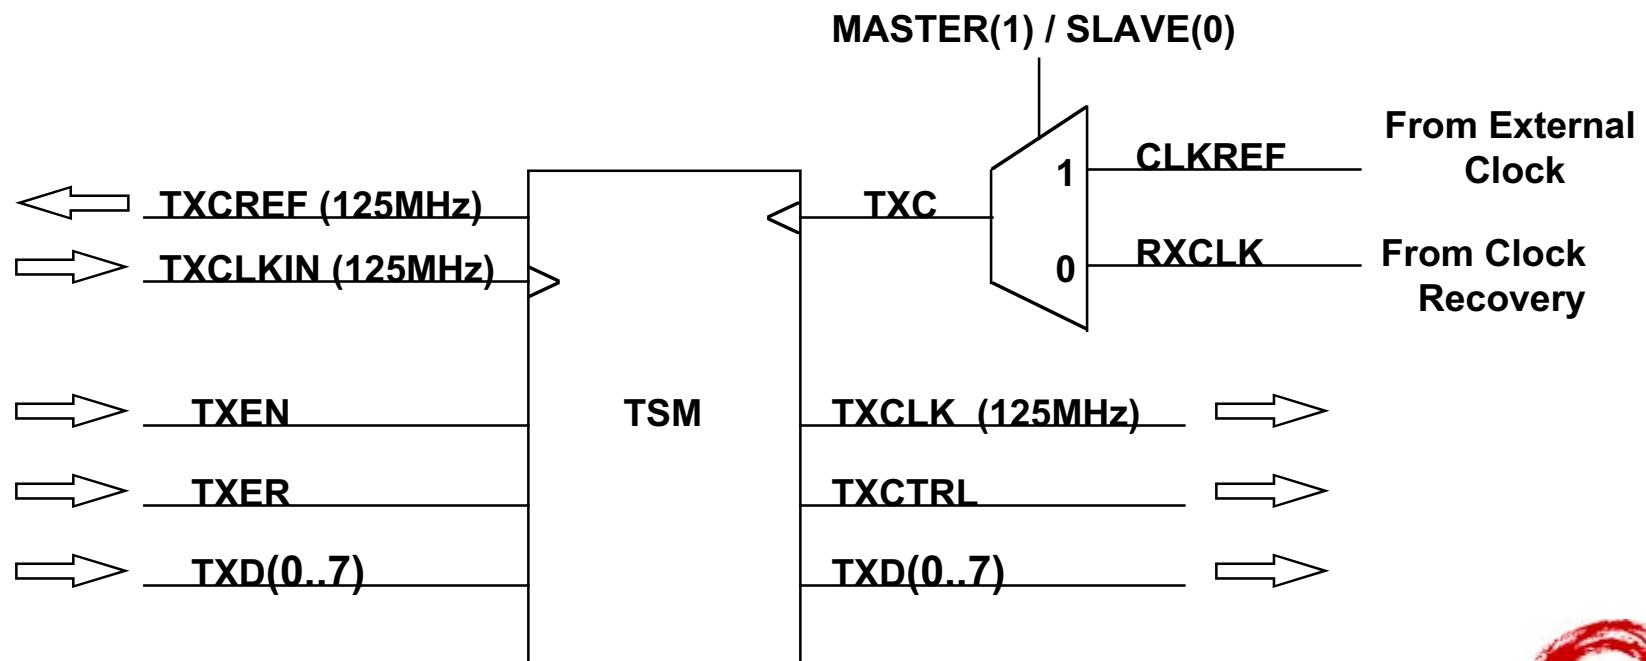

GMII

- **Transmit Interface**
 - TXCLK provided from PHY (referenced to TXCLKIN)
 - 8 Bit Data Path
 - Carrier Extension Support
- **Receive Interface**
 - RXCLK provided from PHY
 - 8 Bit Data Path
 - Carrier Extension Support
- **TSC Interface (optional)**
 - Support for 32 control codes

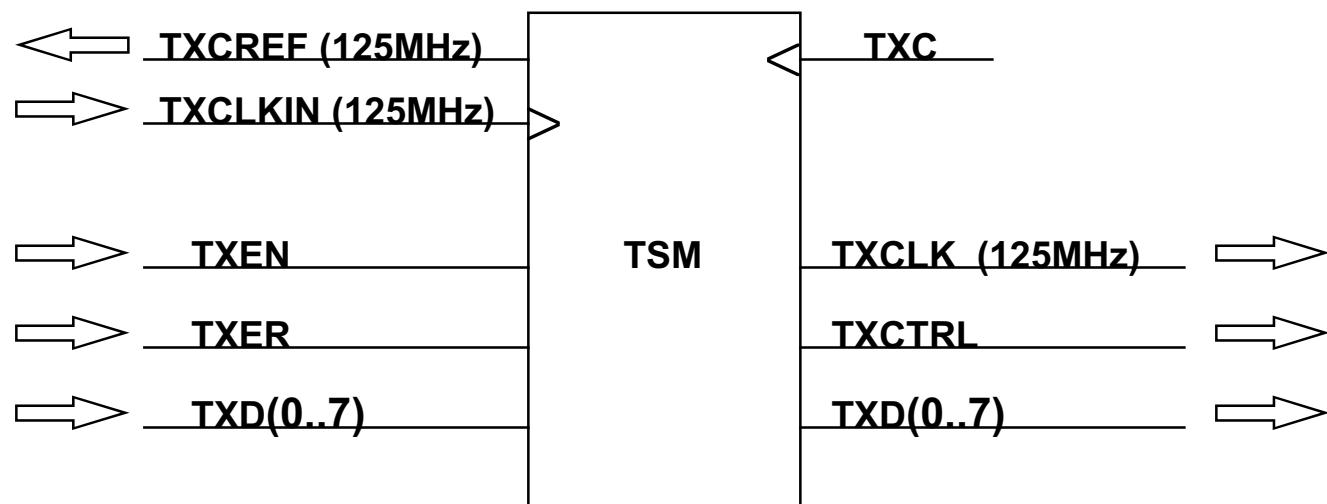

Transmit GMII Interface - Clock

- Clock Reference source is dependent on PHY location
 - Master when PHY is in a HUB
 - Slave when PHY is in a station
- ECHO cancellation requires synchronized timing

Transmit State Machine Function

- Encapsulation of Frame from MAC
 - (SOF/EOF/CRSEXT)
- Error Code Generation
- Idle Generation
 - Idle Code
 - Twisted Pair I.D. Code

Idle Code Function

- Data sent on all 4 pairs
- Different pairs have up to 40ns skew
- Scheme needed to determine the skew between the different pairs
 - Allows for polarity correction
 - Allows for pair swapping

Idle Code Scheme

- Send the general IDLE byte all pair (11111111)
- Every $3 \times n$ bytes simultaneously send the unique TP ID CODE for each individual pair
- Receive side measures skew of each pair for proper data deskewing

Sent Out Of PHY

I	I	I	I	I	TP1	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	
I	I	I	I	I	TP2	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I
I	I	I	I	I	TP3	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I
I	I	I	I	I	TP4	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I

Received by Remote PHY

I	I	I	I	I	TP1	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I
I	I	I	I	I	TP2	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I
I	I	I	I	I	TP3	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I
I	I	I	I	I	TP4	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I	I

Data On The Wire

- A byte is divided into ternary values and then sent down a twisted pair.
- The next byte is sent onto the next twisted pair.

Sequential Bytes
From the Transmit
State Machine

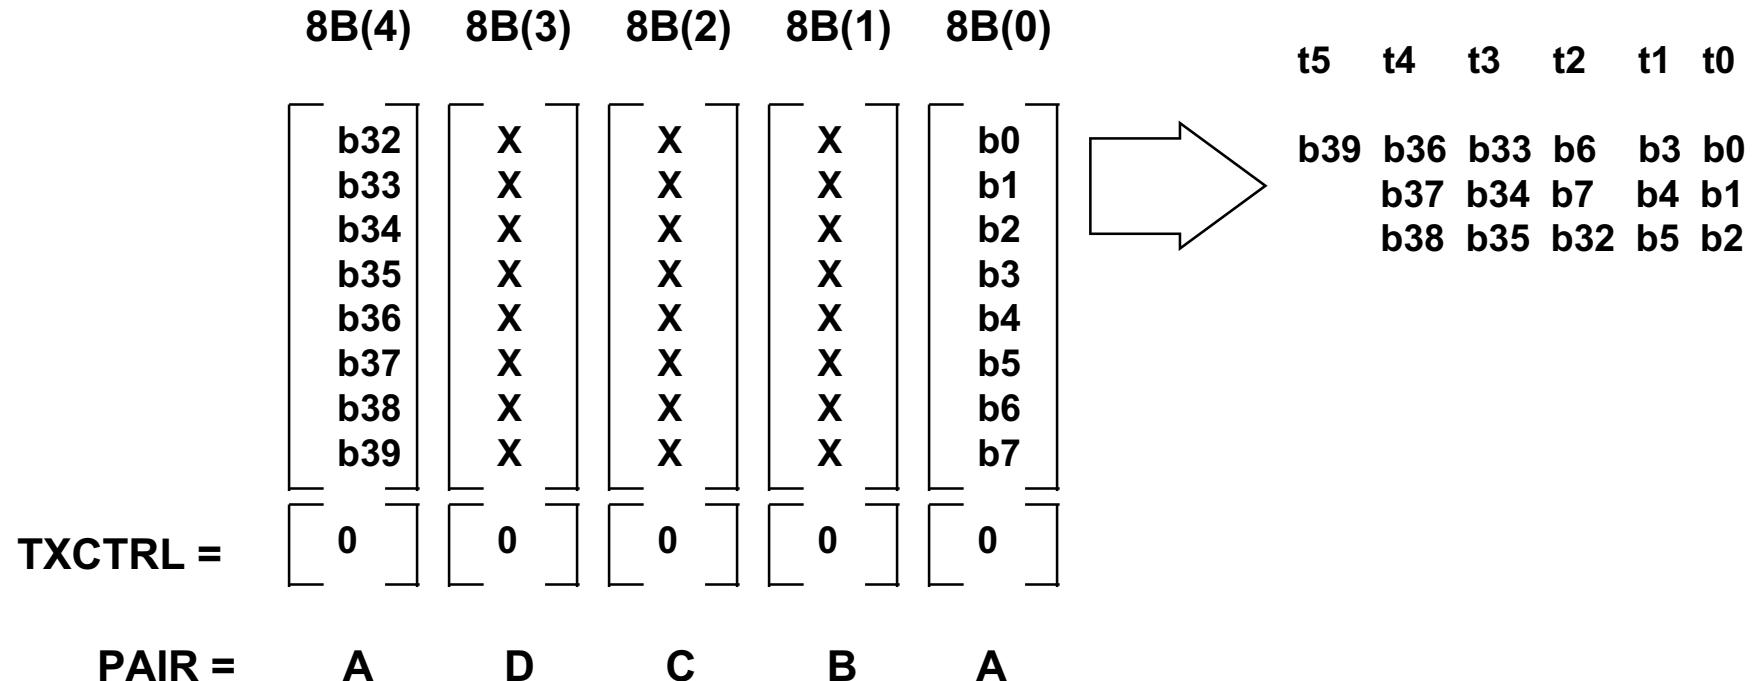

8B(11) 8B(10) 8B(9) 8B(8) 8B(7) 8B(6) 8B(5) 8B(4) 8B(3) 8B(2) 8B(1) 8B(0)

4 twisted pair
wires. With byte align
data in ternary form.

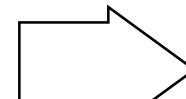

8 Bit Data Conversion To Ternary

- Each Byte is time multiplexed to 2.6 ternary values

Control Signal Sequence

- The first three bits are the ESC symbol followed by 5 control bits.

8B(SOF) = [b0
b1
b2
b3
b4
b5
b6
b7] 

The diagram illustrates a stack of memory cells. On the left, a vertical bracket encloses five memory cells labeled **c0**, **c1**, **c2**, **c3**, and **c4** from bottom to top. To the right of the stack is a large, hollow arrow pointing to the right, representing a pointer variable.

t2	t1	t0
c3	c0	E
c4	c1	S
XX	c2	C

TXCTRL = [X]

GMII Interface

Transmit State Machine

Definition: Control Bits

- Bit selection minimizes error possibility

	C0	C1	C2	C3	C4
SOF	1	0	0	0	0
EOF	0	1	0	1	0
CRSE	0	0	1	1	1
HALT	0	1	1	0	0
TP1	1	0	1	0	0
TP2	1	1	0	0	1
TP3	1	0	0	1	1
TP4	1	0	1	1	0

t2 t1 t0
c3 c0 E
c4 c1 S
XX c2 C

Scrambler

- Helps clock recovery
- Flattens the spectrum (EMC)
- Individual Scramblers per pair simplifies data descrambling
- Ternary scrambler
- Possible Generator polynomials:

$$G(D) := 1 + 2D + D^{13}$$

$$G(D) := 1 + 2D^4 + D^{13}$$

$$G(D) := 1 + 2D^6 + D^{13}$$

$$G(D) := 1 + 2D^7 + D^{13}$$

$$G(D) := 1 + 2D^9 + D^{13}$$

Bit Budget

- **Transmit**
 - TXEN to MDI = 12 Byte Times
- **Receive**
 - MDI to CRS,COL Assertion = 14 Byte Times
 - MDI to RXDV Assertion = 18 Byte Times

Work To Be Done

- Selection Of Scrambler Polynomial
- Definition Of Control Codes
- Define Receive Path
